3. Application Note

3.1 Ceramic Chip Design Guide

When designing the product, the designer needs to consider layout guide and choosing the proper chip antenna base on following design guide.

3.1.1 Regarding to layout issue

1. Antenna position

Antenna location arrangement for PCB

Position A and B are suitable for antenna to radiate property, however, position C is bad for antenna radiation.

2. PCB Ground layer arrangement

Ground layer

No ground layer is beneath antenna.

3. Distance between antenna and ground plane for BT and WALN antenna

Distance vs. Efficiency

The efficiency is saturation when the distance between antenna and ground plane is over 5 mm. In General, 5 mm distance between chip antenna and ground plane is proper design.

4. Layout guide

Base on three considerations, it is proper to place chip antenna to the edge of the pcb with no ground layer beneath the antenna and 5mm away from the ground plane as shown Figure. 9

3.1.2 Select chip antenna to tune.

1. Base on size and center frequency

Sometimes antenna performance is affected by layout and mockup. In order to solve this issue, most of our chip ceramic has multi-types for tuning. Base on 5.3*2.0mm for 2.4G application, there are 7 types with different center frequency, And there are 5 types on 7.8*3.6mm size and 9 types on 3.2*1.6mm size.

Example: 7 types of 5.3*2.0 mm antenna for 2.4G application

2. Matching issue

After selecting suitable type, tuning matching circuit could make better return loss. So matching circuit for antenna should be design when using ceramic antenna.

Matching circuit

3.1.3. Chip Antenna Design Procedure

When customer start to use antenna, its better to follow layout guide or talk to Yageo FAE how to do is better. Layout issue is most important since it could affect above 60% of antenna performance. After customer's mockup is ready, Yageo get mockup from customer and could do technical service, such as figure out which type could fit mockup effect, make better performance by tuning matching circuit and provide our test result of S11, VSWR, radiation pattern and Gain.

3.2. Bulk ceramic antenna

3.2.1 Application note

Figure 13 GPS demo board

Comparison with different GPS size

Difference size (mm) tested under 50*50mm ground plane

The bigger size of GPS antenna has better performance on efficiency.

Ground plane issue

1. Center Frequency

Frequency vs. ground plane

Base on different ground plane, the center frequency will be affected. Fixed the shifted center frequency by tuning design pattern is the only way and we do it for our customer.

2. Efficiency

Efficiency vs. ground plane

Not only center frequency but also efficiency will be affected. And generally bigger ground plane have better performance. However, small product that don't have large ground plane is the trend for current consumer product.

3.2.2 Bulk antenna design procedure

-Bulk antenna is designed from PiFA or patch concept which need ground plane under antenna, and generally the bigger GND plane. Bulk antenna isn't like chip antenna that have multi-pole type. So we directly tune our design pattern to achieve better performance for customer project. Since we tune our pattern for each customer, we will keep our design sample as golden sample for testing spec on mass product.

3.3 Metal Antenna

3.3.1 Metal antenna design procedure

The location where to put with PCB and metal is very important. The common sense is put antenna around edge of the product case, such as A.B, C, and D location. Depend on different antenna design concept for ground plane issue, it's better to discuss with Yageo FAE to find the best solution. When position of antenna is decided and mockup is ready, Yageo could start design antenna and provide our test report around 7 days. And Yageo will create unique p/n of this project for mass product.

4. LTCC Filter and Balun

4.1. Dual Band RF System Block

Below figure is RF circuit for wireless system and. Balun, LPF, BPF and Diplexer are general applied on RF to solve EMI and signal process.

4.2. Filter and Balun Function

What is Balun

Balun is transformer between RFIC and BPF that have below functions.

1. Unbalance port (single port) to balance port (2 ports)
2. Impedance Transformer, such as below.

Balun 50/50: port 1 =50, port 2 = 25, and port 3= 25 ohm

Balun 50/100: port 1 =50, port 2 = 50, port 3= 50 ohm

Balun 50/200: port 1 =50, port 2 = 100, port 3= 100 ohm

What is Filter?

Filter is the function that process EMI or noise from system. Figure23 is example of signal in the system. Signal should be suppressed except center frequency.

Signal in the system

In regard to filter, different functions of filter are developed, seeing below:

LPF (Low Pass Filter)

- High rejection at second harmonic and third harmonic
- Small size
- Low loss

BPF (Band Pass Filter)

- High rejection at second Harmonic and third harmonic
- High rejection at certain frequency for EMI suppress
- High rejection at lower frequency

Diplexer

- Integrate either LPF with HPF or LPF with BPF
- Small size, such as 2.0*1.2mm
- Low loss

-Combo

- Integrate Balun with BPF
- Could be integrated matching circuit. Such as combo for CSR
- Miniaturize size
- High rejection at second Harmonic and third harmonic
- High rejection at certain frequency for EMI suppress
- High rejection below center frequency

6. Appendix 1: Antenna Characteristic

VSWR and Reflected Power

The Voltage Standing Wave Ratio (VSWR) is an indication of how good the impedance match is. VSWR is often abbreviated as SWR. A high VSWR is an indication that the signal is reflected prior to being radiated by the antenna. VSWR and reflected power are different ways of measuring and expressing the same thing.

VSWR	Power Reflection
Infinte	100.0%
5.84	50.0%
3.01	25.0%
2.09	12.5%
1.92	10.0%
1.67	6.3%
1.43	3.1%
1.29	1.6%
1.22	1.0%
1.06	0.1%

Radiation pattern

The antenna radiation pattern is a graphic description in two (2D) or three dimensions (3D) representation of the relative field strength transmitted or received by the antenna.

3D radiation pattern

2D radiation pattern

Isotropic antenna

An antenna pattern is defined by uniform radiation in all directions, produced by an isotropic radiator (point source, a non-physical antenna which is the only nondirectional antenna).

Directional antenna

It has the property of radiating or receiving signal more effectively in some directions than in others. .

Omnidirectional antenna

It has a nondirectional pattern in azimuth and a directional pattern in elevation, such as Dipole antenna.

E-plane and H-plane patterns

E-plane pattern is the plane containing the electric field vector and the direction of maximum radiation. H-plane pattern is the plane containing the magnetic-field vector and the direction of maximum radiation.

Polarization

Polarization is defined as the orientation of the electric field of an electromagnetic wave.

- Linear polarization
 - RHCP (right-hand circular polarization)
 - LHCP (left-hand circular polarization)
- Elliptical polarization

Antenna efficiency

Efficiency (e_{cd}) is a figure showing the ratio of the total radiated power (P_{rad}) to the total input Power (P_{in}). Efficiency has no unit and the ideal figure is 1.

$$e_{cd} = \frac{P_{rad}}{P_{in}}$$
