IRS21956S

Floating Input, High and Low(Dual mode) Side Driver

Features

- Low side programmable ramp gate drive
- Low side generic gate drive integrated using the same low side output pin
- High side generic gate driver
- Under voltage lockout for VDD, VCC & VBS
- Floating 5V input logic compatible
- Tolerant to negative transient voltage on Vs
- Shoot through prevention
- RoHS compliant

Product Summary

Topology	PDP
V_{OFFSET}	≤ 600 V
LO SR$_+$	4.5V/us
I_{o+} & I_{o-} (typical)	0.5A & 0.5A
t_{ON} & t_{OFF} (typical)	300ns & 280ns

Package Options

20-Lead SOIC

IRS21956S

Description

The IRS21956 is high voltage and programmable ramp slope control gate driver for MOSFET and IGBT with single low side dual mode driver, high side driver and floating 5V input. Proprietary HVIC and latch immune CMOS technologies enable ruggedized monolithic construction. The floating logic input is compatible with standard 5V CMOS or LSTTL output. The output driver features a programmable slope control by external R/C and input signals. The floating channels can be used to drive an N-channel power MOSFET or IGBT in the high side configuration, which operates up to 600 volts above the COM ground.

Recommended Operating Conditions

For proper operation, the device should be used within the recommended conditions. All voltage parameters are absolute voltages referenced to COM.
The offset rating are tested with supplies of (V_{CC}-COM) = (V_B-V_S)=15V.
