

3.1-V to 5.5-V Input, 3-A Output, Synchronous, Step-Down Regulator with Integrated FETs

Check for Samples: [TPS51312](#)

FEATURES

- D-CAP2™ Mode Enables Fast Transient Response
- No External Compensation Required
- Input Voltage V_{IN} Range: 3.1 V to 5.5 V
- Bias Voltage V_{CC} Range: 3.1 V to 5.5 V
- Output Voltage Range: 0.6 V to 3.3 V
- 0.6-V, 1% Voltage Reference Accuracy
- Fixed Voltage Servo Soft-Start Function
- Auto-Skip, Eco-mode™ for High Efficiency at Light Loads
- Switching Frequency: 900-kHz
- UVLO, UVP, OTP and OVP Power Good Output
- Cycle-By-Cycle Current Limit, Latch-off OCP
- Thermally Enhanced 3 mm x 3 mm, 10-pin SON (DRC)

APPLICATIONS

- Battery Powered Equipment
- Notebook Computers

DESCRIPTION

The TPS51312 is a high-efficiency, synchronous, step-down DC/DC converter. It supports 3-A (maximum) of dc output current at output voltages from 0.6 V to 3.3 V. The D-CAP2 mode adaptive on-time control allows a small footprint when designed using all ceramic output capacitors and offers a low external component count. The device also features auto-skip function at light load condition, pre-biased start-up and internally fixed soft-start time. When the device is disabled, the output capacitor is discharged through internal resistor.

The TPS51312 is available in a 3 mm x 3 mm, 10-pin DRC package (Green RoHS compliant and Pb free) and is specified between -40°C and 85°C .

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

APPLICATION INFORMATION

Functional Overview

TPS51312 is a D-CAP2 mode adaptive on time converter with internal integrator. Monolithically integrate high side and low side FET supports output current to a maximum of 3-ADC. The converter automatically runs in discontinuous conduction mode to optimize light load efficiency. A switching frequency of 900 kHz enables optimization of the power train for the cost, size and efficiency performance of the design.

PWM Operation

The PWM operation is comprised of three separate loops, A, B and C as shown in Figure 9.

UDG-12133

Figure 9. ¾PWM Operation

Internal Current Loop (A)

Loop A is the internal current loop. The current information is sampled, divided and averaged at the SW node. The RC time constant and the gain of the current sense amplifier is chosen to cover the wide range of power stage design intended for this application.

Internal Voltage Loop (B)

Loop B is the internal voltage loop. The feedback voltage information is compared to the voltage reference at the input of the g_M amplifier, the internal integrator is designed to provide a zero at the double pole location to boost phase margin at the desired crossover frequency.

Fast Feedforward Loop (C)

Loop C is the additional loop that acts a direct fast feedforward loop to enhance the transient response.

In steady state operation as shown in [Figure 10](#), the on time is initiated by the interaction of the three loops mentioned above. When the $(V_C - V_{CS})$ is rising above threshold defined by $(V_{FB} - V_{REF})$, the PWM comparator issues the on time pulse after the propagation delay. The demand of on time occurs when the artificial current has reached the valley point. The load regulation is maintained by the integrator provided by the g_M amplifier and integrator.

In transient operation as shown in [Figure 11](#), the benefit of this topology is becoming evident. In an all MLCC output configuration, especially when the output capacitance is low, when the load step is applied, the output voltage is immediately discharged to try to keep the load demand. The immediate reflection of the load demand is instantly reflected in the FB voltage. The $(V_{FB} - V_{REF})$ is thus served as a termination voltage level for the $(V_C - V_{CS})$, thus modulating the initiation of the on time. The transient response can be improved further by amplifying the difference between V_{FB} and the V_{REF} reference.

Figure 10. Steady-State Operation

Figure 11. Transient Operation

PWM Frequency

The TPS51312 operates at a switching frequency of 900 kHz.

Light Load Power Saving Features

The TPS51312 offers an automatic pulse-skipping feature to provide excellent efficiency over the entire load range. The converter senses the current during low side FET on and prevents negative current flow by turning off the low side FET. This saves power by eliminating re-circulation of the inductor current. When the bottom FET is turned off, the converter enters discontinuous mode, and the switching frequency decreases, reducing switching loss.

Power Sequences

TPS51312 initiates the soft-start process when the EN, VIN and VCC pins are ready. The soft-start time 300 μ s when the reference voltage is between 0 V and 0.6 V (V_{REF}). The actual voltage ramp up time is the same as that of the V_{REF} start-up time, which is 300 μ s.

Power Good Signal

The TPS51312 has one open-drain power good (PGOOD) pin. During initial startup, there is a 1.3-ms power good high propagation delay after EN goes high. The PGOOD de-asserts when the EN is pulled low or an undervoltage condition on VCC or VIN or any other faults (such as V_{OUT} , UVP, OCP, OVP) that require latch off action is detected.

Protection Features

The TPS51312 offers many features to protect the converter power chain as well as the system electronics.

Input Undervoltage Protection on V_{CC} and V_{IN} (UVLO)

The TPS51312 continuously monitor the voltage on the V_{CC} and V_{IN} to ensure the voltage level is high enough to bias the converter properly and to provide sufficient gate drive potential to maintain high efficiency for the converter. The converter starts with V_{CC} and V_{IN} approximately 2.95 V and has a nominal of 250 mV of hysteresis, assuming EN is above the logic threshold level. If the UVLO level is reached for either V_{CC} or V_{IN} , the converter transitions the SW node into a tri-state and remains off until the device is reset by both V_{CC} and V_{IN} reaches 2.95 V (nominal). The PGOOD is deasserted when UVLO is detected and remains low until the device is reset.

Output Overvoltage Protection (OVP)

The TPS51312 has OVP protection circuit. An OVP event is detected when the FB voltage is approximately $130\% \times 0.6V_{REF}$. In this case, the converter de-asserts the PGOOD signal and performs the overvoltage protection function. The converter latches off both high-side and low-side FET and remains in this state after a delay of 1.9 μ s (typ) until the device is reset by EN, or V_{CC} or V_{IN} .

Output Undervoltage Protection (UVP)

Output undervoltage protection works in conjunction with the current protection described in the [Overcurrent and Current Limit Protection](#) section. If the FB voltage drops below $50\% \times 0.6 V_{REF}$, after a delay of 2.4 μ s (typ), the converter latches off. Undervoltage protection can be reset by EN, V_{CC} or V_{IN} .

Overcurrent and Current Limit Protection

The TPS51312 provides an overcurrent protection function. The nominal OCP is 4.8-A DC. When the current limit is exceeded for consecutive 9 cycles, the converter latches off and remains latched off until it is reset by EN, V_{CC} or V_{IN} .

The TPS51312 also provides current limit protection function. If the sense current is above the OCL setting, the converter delays the next on pulse until the current level drops below the OCL limit. Current limiting occurs on a pulse-by-pulse basis. During a fast or very fast overcurrent event, the output voltage tends to droop until the UVP limit is reached. Then the converter de-asserts the PGOOD signal, and latches off after a typical delay time of 2.4 μ s. The converter remains in this state until the device is reset by EN, V_{CC} or V_{IN} .

Thermal Protection

The TPS51312 has an internal temperature sensor. When the die temperature reaches a nominal of 145°C, the device shuts down until the temperature cools by approximately 20°C. Then the converter restarts. The thermal shutdown is a non-latched behavior.

REFERENCE DESIGN

Application Schematic

Figure 12 shows the application schematic..

UDG-12145

Figure 12. Reference Design Schematic

Table 1. Reference Design List of Materials

FUNCTION	MANUFACTURER	PART NUMBER
Output Inductor	Vishay	IHLP-2020BZ-01
Ceramic Output Capacitors	Panasonic	ECJ2FB0J226M
	Murata	GRM21BR60J226ME39L

Design Procedure

Step One. Determine the specifications.

- $V_{OUT} = 1.8 \text{ V}$
- $I_{CC(max)} = 3 \text{ A}$
- $di/dt = 2.5 \text{ A}/\mu\text{s}$

Step Two. Determine the system parameters.

The input voltage range and operating frequency are of primary interest. For example,

- $V_{IN} = V_{CC} = 5 \text{ V}$
- $f_{SW} = 900 \text{ kHz}$.

TPS51312

SLUSB57 –SEPTEMBER 2012

www.ti.com

Step Three. Set the output voltage.

Use Equation 1 to determine the output voltage.

$$V_{OUT} = V_{REF} \times \left(\frac{R_{FB1} + R_{FB2}}{R_{FB2}} \right) \quad (1)$$

The output voltage is determined by VREF (0.6 V) and the resistor dividers (R_{FB1} and R_{FB2}). The output voltage is regulated to the FB pin. For the current reference design of 1.8 V, select 40 kΩ as the value for R_{FB1} and 20 kΩ as the value of R_{FB2} (see Figure 12). As a recommendation, choose a value of less 50 kΩ both resistors. Place a 47-pF, feedforward capacitor in parallel with R_{FB1} to help reduce the output voltage ripple during the transition from DCM to CCM.

Step Four. Determine inductor value and choose inductor.

Smaller inductance yields better transient performance but the consequence is higher ripple and lower efficiency. Higher values have the opposite characteristics. It is common practice to limit the ripple current to 25% to 50% of the maximum current. In this case, use 40%:

$$I_{P-P} = 3 \text{ A} \times 0.4 = 1.2 \text{ A}$$

where

- f_{SW} = 900 kHz
- V_{IN} = 5 V
- V_{OUT} = 1.8 V

$$L = \frac{V \times dT}{I_{P-P}} = \left(\frac{(V_{IN} - V_{OUT})}{I_{P-P}} \right) \times \left(\frac{V_{OUT}}{(f_{SW} \times V_{IN})} \right) = 1 \mu\text{H} \quad (2)$$

For this application, choose a 1-μH, 18.9-mΩ inductor from Vishay part number IHLP-2020BZ-01.

Step Five. Determine the output capacitance.

To determine C_{OUT} based on transient and stability requirement, first calculate the minimum output capacitance for a given transient.

Equation 4 and Equation 5 calculate the minimum output capacitance for meeting the transient requirement.

$$C_{OUT(min_under)} = \frac{L \times \Delta I_{LOAD(max)}^2 \times \left(\frac{V_{VOUT} \times t_{SW}}{V_{IN(min)}} + t_{MIN(off)} \right)}{2 \times \Delta V_{LOAD(insert)} \times \left(\left(\frac{V_{IN(min)} - V_{VOUT}}{V_{IN(min)}} \right) \times t_{SW} - t_{MIN(off)} \right) \times V_{VOUT}} \quad (4)$$

$$C_{OUT(min_over)} = \frac{L_{OUT} \times (\Delta I_{LOAD(max)})^2}{2 \times \Delta V_{LOAD(release)} \times V_{VOUT}} \quad (5)$$

Table 2. Choosing Output Inductors and Output Capacitors

TEMPERATURE	OUTPUT VOLTAGE V _{OUT} (V)	INDUCTANCE L _{OUT} (μH)	OUTPUT CAPACITORS		FAST FEEDFORWARD CAPACITOR C _{FF} (pF)
			NUMBER	VALUE (μF)	
-10°C ≤ T _A ≤ 85°C	1.5	1	1	22	47
	1.8	1	1		
	3.3	2.2	2		
-40°C ≤ T _A ≤ 85°C	1.5	1	2		
	1.8	1	2		
	3.3	2.2	3		

Step Six. Establishing the internal compensation loop.

The TPS51312 is designed with an internal compensation loop. The internal integrator zero location is approximately 60 kHz. During the time that the power stage double pole frequency contributed by the L_{OUT} and C_{OUT} is less than or equal to that of the zero location, the converter is stable with sufficient margin.

Step Seven. Select decoupling and peripheral components.

For TPS51312 peripheral capacitors use the following minimum value of ceramic capacitance, X5R or better temperature coefficient is recommended. Tighter tolerances and higher voltage ratings are always appropriate.

V_{CC} and V_{IN} decoupling $\geq 2 \times 10 \mu F$, 6.3 V

Pull up resistor on PGOOD = 100 k Ω

Layout Considerations

Good layout is essential for stable power supply operation. Follow these guidelines for an efficient PCB layout.

- Place V_{IN} , V_{CC} decoupling capacitors as close to the device as possible.
- Use wide traces for the VIN, SW and GND pins. These nodes carry high current and also serve as heat sinks.
- Place FB and voltage setting dividers as close to the device as possible.
- Place an R-C network from SW to GND to help to reduce the voltage spikes on the SW pin.

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package Pins	Package qty Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
TPS51312DRCR	Active	Production	VSON (DRC) 10	3000 LARGE T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 85	S51312
TPS51312DRCT	Active	Production	VSON (DRC) 10	250 SMALL T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 85	S51312

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
