

GaAs HBT PROGRAMMABLE 5-BIT COUNTER, DC - 2.2 GHz

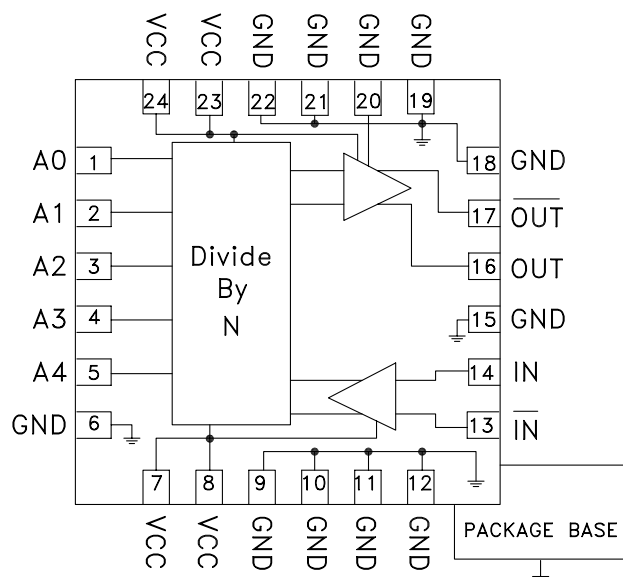

Typical Applications

Programmable divider for offset synthesizer and variable divide by N applications:

- Satellite Communication Systems
- Point-to-Point and Point-to-Multi-Point Radios
- LMDS
- SONET

Functional Diagram

Features

- SSB Phase Noise: -153 dBc/Hz @ 100 kHz
- Selectable Division from 2 to 32
- Parallel 5-Bit Control
- Wide Input Power Range: -20 to +10 dBm
- 24 Lead 4x4mm QFN Package: 9 mm²

General Description

The HMC394LP4 & HMC394LP4E are low noise GaAs HBT programmable 5-bit counters in 4 x 4mm leadless surface mount packages. This device allows continuous division from N= 2 to 32 at input frequencies up to 2.2 GHz. The output voltage swing is 800 mV with a duty cycle inversely proportional to N. The low additive SSB phase noise of -153 dBc/Hz at 100 KHz offset makes this counter an excellent choice for low noise synthesizer applications.

Electrical Specifications, $T_A = +25^\circ\text{C}$, 50 Ohm System, $V_{CC} = 5V$

Parameter	Conditions	Min.	Typ.	Max.	Units
Maximum Input Frequency		2.2			GHz
Minimum Input Frequency	Sine Wave Input [1]			0.1	GHz
Input Power Range	$F_{in} = 0.1$ to 2.2 GHz	-15	>-20	+10	dBm
Output Power	Divide-by-2		4		dBm
SSB Phase Noise	$F_{in} = 1$ GHz, $N = 4$		-153		dBc/Hz
Output Transition Time			100		ps
Supply Current (I_{CC})			194		mA

1. Divider will operate down to DC for square-wave input signal.

Evaluation PCB

The circuit board used in the application should use RF circuit design techniques. Signal lines should have 50 Ohm impedance while the package ground leads and backside ground slug should be connected directly to the ground plane similar to that shown. A sufficient number of via holes should be used to connect the top and bottom ground planes. The evaluation circuit board shown is available from Hittite upon request.

Note: The evaluation PCB for the HMC394LP4 contains 10K Ohm pull up resistors for each of the five control inputs A0 through A4. Programming the 31 distinct division ratios consists of installing or removing jumpers S1 through S5, as shown above. Jumper S6 must always be installed to provide ground to pin 20.

Asynchronous Programming

The 5-Bit programmable counter counts-down from the programmed value of the data bits to zero and issues an output pulse at the end of each cycle. Settling time of the programmable 5-Bit counter is defined as the maximum time required for the counter to change the division ratio N to a new value after the data bits have settled. The worst case settling time occurs if the data bits A0 thru A4 are changing during the load cycle. Under this condition, the data bits may potentially be erroneous when they are clocked in and in the worst case could be all 1's, requiring 32 clock cycles until the correct data is re-loaded into the flip flops. The worst case asynchronous settling time can be calculated as follows:

$$T_{\text{SETTLING MAX}} = 32/f_{\text{IN}} \text{ (For Asynchronous Programming)}$$

As an example, if the input frequency is 1 GHz, the maximum settling time is 32 nS

Synchronous Programming

For applications which can not tolerate a momentary undefined division ratio, which normally occurs while changing the data bits (A0-A4) at random, synchronous programming can be used. Data is loaded into the counter on every rising edge of the clock which occurs while the output (OUT) is "HIGH". The typical minimum setup and hold times are shown in the table below as a function of frequency. For precision applications, the rising edge of the complementary output may be used to latch the new data bits (A0-A4), so that all bits are settled before the next load cycle.

$$T_{\text{SETTLING MAX}} = N/f_{\text{IN}} \text{ (For Synchronous Programming)}$$

Where N is the desired division ratio, and f_{IN} = Input Frequency (Hz)

Parameter	0.5 GHz	1 GHz	2 GHz
t_{SETUP}	200 ps	200 ps	200 ps
t_{HOLD}	700 ps	300 ps	120 ps

CMOS/TTL Input Characteristics

Maximum Input Logic "0" Voltage ($V_{IL\ MAXIMUM}$) = 1.1V @ 10 μ A.

Minimum Input Logic "1" Voltage ($V_{IH\ MINIMUM}$) = 1.8V @ 500 μ A.

Input IV characteristics for the logic inputs (A0-A4) are shown below:
