

TPS7510x Low Dropout, Two-Bank LED Driver With PWM Brightness Control

1 Features

- Regulated Output Current with 2% LED-to-LED Matching
- Drives Up to Four LEDs at 25 mA Each in a Common Cathode Topology
- 28-mV Typical Dropout Voltage Extends Usable Supply Range in Li-Ion Battery Applications
- Brightness Control Using PWM Signals
- Two 2-LED Banks With Independent Enable and PWM Brightness Control per Bank
- No Internal Switching Signals—Eliminates EMI
- Default LED Current Eliminates External Components
 - Default Values from 3 mA to 10 mA (in 1-mA Increments) Available Using Innovative Factory EEPROM Programming
 - Optional External Resistor can be Used for High-Accuracy, User-Programmable Current
- Over current and Over temperature Protection
- Available in Wafer Chip-Scale Package or 2.50-mm × 2.50-mm WSON-10

2 Applications

- Keypad and Display Backlighting
- White and Color LEDs
- Cellular Handsets
- PDAs and Smartphones

3 Description

The TPS7510x linear low dropout (LDO) matching LED current source is optimized for low-power keypad and navigation pad LED backlighting applications. The device provides a constant current to up to four unmatched LEDs organized in two banks of two LEDs each in a common-cathode topology. Without an external resistor, the current source defaults to a factory-programmable, preset current level with $\pm 0.5\%$ accuracy (typical). An optional external resistor can be used to set initial brightness to user-programmable values with higher accuracy. Brightness can be varied from off to full brightness by inputting a pulse width modulation (PWM) signal on each enable pin (ENx, where x indicates LED bank A or B). Each bank has independent enable and brightness control, but current matching is done to all four channels concurrently. The input supply range is ideally suited for single-cell Li-Ion battery supplies and the TPS7510x can provide up to 25 mA per LED.

No internal switching signals are used, eliminating troublesome electromagnetic interference (EMI). The TPS7510x is offered in an ultra-small, 9-ball, 0.4-mm ball-pitch wafer chip-scale package (WCSP) and a 2.50-mm × 2.50-mm, 10-pin WSON package, yielding a very compact total solution size ideal for mobile handsets and portable backlighting applications. The device is fully specified over $T_J = -40^{\circ}\text{C}$ to $+85^{\circ}\text{C}$.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision I (November 2013) to Revision J	Page
Added <i>Device Information</i> table, <i>Typical Application Diagram</i> title to front-page diagram, <i>ESD Ratings</i> table, <i>Thermal Information</i> table, <i>Feature Description</i> section, <i>Device Functional Modes</i> section, <i>Application and Implementation</i> section, <i>Power Supply Recommendations</i> section, <i>Layout</i> section, <i>Device and Documentation Support</i> section, and <i>Mechanical, Packaging, and Orderable Information</i> section	1
Changed SON to WSON throughout document	1
Deleted pin out drawings from <i>Typical Application Diagram</i> figure	1
Changed I/O status to I from O in D1B row of <i>Pin Functions</i> table	3
Deleted <i>Dissipation Ratings</i> table	4

Changes from Revision H (January 2010) to Revision I	Page
Changed test conditions for ground current parameter in the <i>Electrical Characteristics</i>	5
Deleted Figure 14; duplicate mechanical image.	12

Changes from Revision G (March 2009) to Revision H	Page
Revised ground current parameter, <i>Electrical Characteristics</i> ; changed symbol from I_Q to I_{GND} ; added specifications for YFF and DSK packages	5
Added YFF and DSK package specifications for current matching parameter, <i>Electrical Characteristics</i>	5
Changed diode current accuracy parameter, <i>Electrical Characteristics</i> , to reflect YFF and DSK package specifications	5
Deleted operating junction temperature range specification from <i>Electrical Characteristics</i> table to eliminate redundancy	5

Pin Functions

PIN			I/O	DESCRIPTION
NAME	WCSP	WSON		
ENA	A3	2	I	Enable pin, Bank A. Driving this pin high turns on the current source to Bank A outputs. Driving this pin low turns off the current source to Bank A outputs. An applied PWM signal reduces the LED current (between 0 mA and the maximum current set by I_{SET}) as a function of the duty cycle of the PWM signal. ENA and ENB can be tied together. ENA can be left OPEN or connected to GND if not used. See the Application and Implementation section for more details.
D1A	B3	3	O	Diode source current output, Bank A. Connect to LED anode.
D2A	C3	4	O	Diode source current output, Bank A. Connect to LED anode.
ENB	A2	1	I	Enable pin, Bank B. Driving this pin high turns on the current source to Bank B outputs. Driving this pin low turns off the current source to Bank B outputs. An applied PWM signal reduces the LED current (between 0 mA and the maximum current set by I_{SET}) as a function of the duty cycle of the PWM signal. ENA and ENB can be tied together. ENB can be left OPEN or connected to GND if not used. See the Application and Implementation section for more details.
V_{IN}	B2	9	I	Supply input
GND	C2	5, Pad	—	Ground
I_{SET}	A1	10	I	An optional resistor can be connected between this pin and GND to set the maximum current through the LEDs. If no resistor is connected, I_{SET} defaults to the internally programmed value.
D1B	B1	8	O	Diode source current output, Bank B. Connect to LED anode.
D2B	C1	7	O	Diode source current output, Bank B. Connect to LED anode.
NC	—	6	—	Not internally connected

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)

	MIN	MAX	UNIT
V_{IN} range	−0.3	7	V
V_{ISET} , V_{ENA} , V_{ENB} , V_{DX} range	−0.3	V_{IN}	V
I_{DX} for D1A, D2A, D1B, D2B	35		mA
D1A, D2A, D1B, D2B short-circuit duration	Indefinite		
Continuous total power dissipation	Internally limited		
Junction temperature, T_J	−55	150	°C
Storage temperature, T_{stg}	−55	150	°C

6.2 ESD Ratings

	VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±500

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

PARAMETER	MIN	NOM	MAX	UNIT
V_{IN} Input voltage	2.7		5.5	V
I_{DX} Operating current per LED	3		25	mA

7 Detailed Description

7.1 Overview

The TPS7510x linear low dropout (LDO) matching LED current source is optimized for low-power keypad and navigation pad LED backlighting applications. The device provides a constant current to up to four unmatched LEDs organized in two banks of two LEDs each in a common-cathode topology. Brightness can be varied from off to full brightness by inputting a pulse width modulation (PWM) signal on each enable pin (ENx, where x indicates LED bank A or B). Each bank has independent enable and brightness control, but current matching is done to all four channels concurrently. The input supply range is ideally suited for single-cell Li-Ion battery supplies and the TPS7510x can provide up to 25 mA per LED.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Load Regulation

The TPS7510x is designed to provide very tight load regulation. In the case of a fixed current source, the output load change is a change in voltage. Tight load regulation means that output voltages (LED forward voltages) with large variations can be used without impacting the fixed current being sourced by the output or the output-to-output current matching. The permissible variation on the output not only allows for large variations in white LED forward voltages, but even permits the use of different color LEDs on different outputs with minimal effect on output current.

7.3.2 Line Regulation

The TPS7510x is also designed to provide very tight line regulation. This architecture allows for voltage transient events to occur on the power supply (battery) without effecting the fixed output current levels or the output-to-output current matching. A prime example of such a supply transient event is the occurrence of a transmit pulse on the radio of a mobile handset. These transient pulses can cause variations of 300 mV and 600 mV on the supply to the TPS7510x. The line regulation limitation is that the lower supply voltage level of the event does not cause the input-to-output voltage difference to drop below the dropout voltage range.

7.4 Device Functional Modes

7.4.1 LED ON

Apply 1.2 V or more to ENx to turn the LED bank on.

7.4.2 LED OFF

Apply a voltage less than or equal to 0.4V to ENx to turn the LED bank off.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The TPS7510x provides a constant current to up to four unmatched LEDs organized in two banks of two LEDs each in a common-cathode topology. Without an external resistor, the current source defaults to a factory-programmable, preset current level with $\pm 0.5\%$ accuracy (typical). An optional external resistor can be used to set initial brightness to user-programmable values with higher accuracy. Brightness can be varied from off to full brightness by inputting a pulse width modulation (PWM) signal on each enable pin (ENx, where x indicates LED bank A or B). Each bank has independent enable and brightness control, but current matching is done to all four channels concurrently. The input supply range is ideally suited for single-cell Li-Ion battery supplies and the TPS7510x can provide up to 25 mA per LED. No internal switching signals are used, eliminating troublesome electromagnetic interference (EMI). The device is fully specified over $T_J = -40^\circ\text{C}$ to $+85^\circ\text{C}$.

8.1.1 Setting the Output Current Level

The TPS7510x is a quad matched current source. Each of the four current source output levels is set by a single reference current. An internal voltage reference of 1.225 V (nominal) in combination with a resistor sets the reference current level. This reference current is then mirrored onto each of the four outputs with a ratio of typically 420:1. The resistor required to set the LED current is calculated using [Equation 1](#):

$$R_{\text{ISET}} = \frac{K \times V_{\text{ISET}}}{I_{\text{LED}}}$$

where:

- K is the current ratio
- V_{ISET} is the internal reference voltage
- I_{LED} is the desired LED current

(1)

For example, to set the LED current level to 10mA, a resistor value of 51.1 k Ω is required. This value sets up a reference current of 23.9 μA (1.22 V / 51.1 k Ω). In turn, this reference current is mirrored to each output current source, resulting in an output current of 10 mA (23.9 $\mu\text{A} \times 420$).

The TPS7510x offers two methods for setting the output current levels. The LED current is set either by connecting a resistor (calculated using [Equation 1](#)) from the I_{SET} pin to GND, or leaving I_{SET} unconnected to employ the factory-programmed R_{SET} resistance. The internal programmed resistance is implemented using high-precision processing and yields a reference current accuracy of 0.5%, nominal. Accuracy using external resistors is subject to the tolerance of the external resistor and the accuracy of the internal reference voltage.

The TPS7510x automatically detects the presence of an external resistor by monitoring the current out of the I_{SET} pin. Current levels in excess of 3 μA signify the presence of an external resistor and the device uses the external resistor to set the reference current. If the current from I_{SET} is less than 3 μA , the device defaults to the preset internal reference set resistor. The TPS7510x is available with eight preset current levels, from 3 mA to 10 mA (per output) in 1-mA increments. Solutions using the preset internal current level eliminate an external component, thereby increasing accuracy and reducing cost.

Application Information (continued)

Table 1. Recommended (1% Tolerance) Set Resistor Values

R_{SET} (kΩ)	I_{SET} (μA)	I_{DX} (mA)⁽¹⁾
511	2.4	1.0
255	4.8	2.0
169	7.2	3.0

20.5	59.8	25.1

(1) $I_{DX} = (V_{SET} / R_{SET}) \times k$.

8.1.2 Limitations on LED Forward Voltages

The TPS7510x is a linear current source implementing LDO regulator building blocks. Therefore, to maintain accurate operation, there are some limitations to the forward (output) voltages that can be used. The first limitation is the maximum LED forward voltage. The dropout voltage must be considered because LDO technology is employed. The TPS7510x is an ultra-low dropout device with typical dropouts in the range of 30 mV at 5 mA. Care must be taken in the design to ensure that the difference between the lowest possible input voltage (for example, battery cut-off) and the highest possible forward voltage yields at least 100 mV of headroom. Headroom levels less than dropout decrease the accuracy of the current source (see [Figure 6](#)).

The other limitation to consider is the minimum output voltage required to yield accurate operation. The current source employs NMOS MOSFETs, and a minimum forward LED voltage of approximately 1.5 V on the output is required to maintain highest accuracy. The TPS7510x is ideal for white LEDs and color LEDs with forward voltages greater than 1.5 V. This range includes red LEDs that have typical forward voltages of 1.7 V.

8.1.3 Use of External Capacitors

The TPS7510x does not require the use of any external capacitors for stable operation. Nominal stray and power-supply decoupling capacitance on the input is adequate for stable operation. Capacitors are not needed for stability and are therefore not recommended on the outputs.

8.1.4 Use of Unused Outputs or Tying Outputs Together

Unused outputs can be left unconnected or tied to the V_{IN} supply. Although open outputs are acceptable, tying unused outputs to the V_{IN} supply increases ESD protection. Connecting unused outputs to ground violates the minimum recommended output voltage, results in current levels that potentially exceed the set or preset LED current, and must be avoided.

Connecting outputs in parallel is an acceptable way of increasing the amount of LED current drive. This configuration is a useful trick when the higher current level is a multiple of the preset value.

8.1.5 Use of Enable Pins for PWM Dimming

The TPS7510x divides control of the LED outputs into two banks of two current sources each. Each bank is controlled by the use of an independent, active-high enable pin (ENA and ENB). The enable pin can be used for standard ON or OFF operation of the current source, driven by standard logic levels from processor GPIO pins, for example. Drive ENx high to turn on the bank of LEDs; drive ENx low to turn off the bank of LEDs.

Another use of the enable pins is for LED dimming. LED brightness is a function of the current level being driven across the diode and the time that current is being driven through the diode. The perceived brightness of an LED can be changed by either varying the current level or, more effectively, by changing the time in which that current is present. When a PWM signal is input into the enable pin, the duty cycle (high- or on-time) determines how long the fixed current is driven across the LEDs. Reducing or increasing that duration has the effect of dimming or brightening the LED, without having to employ the more complex method of varying the current level. This technique is particularly useful for reducing LED brightness in low ambient light conditions, where LED brightness is not required, thereby decreasing current consumption. The enable pins can also be used for LED blinking, varying blink rates based on system status.

Although providing many useful applications, PWM dimming does have a minimum duty cycle required to achieve the required current level. The recommended minimum on-time of the TPS7510x is approximately 33 μ s. On-times less than 33 μ s result in reductions in the output current by not allowing enough time for the output to reach the desired current level. Also, having both enables switching together, asynchronously, or having one enable on at all times, effects the minimum recommended on-time (see Figure 4 and Figure 5). If one enable is already on, the speed at which the other channel turns on is faster than if both channels are turning on together or if the other channel is off. Therefore, already having one channel enabled allows for approximately 10- μ s to 12- μ s shorter minimum on-times for the switching channel.

Unused enable pins can be left unconnected or connected to ground to minimize current consumption. Connecting unused enable pins to ground increases ESD protection. If connected to V_{IN} , a small amount of current drains through the enable input (see the [Electrical Characteristics](#) table).

8.2 Typical Application

11 Device and Documentation Support

11.1 Device Support

11.1.1 Development Support

Two evaluation modules (EVMs) are available to assist in the initial circuit performance evaluation using the TPS7510x. The TPS75105EVM-174 and TPS75105DSKEVM-529 evaluation modules (and related user guides) can be requested at the Texas Instruments website through the product folders or purchased directly from the TI eStore.

11.1.2 Device Nomenclature

PRODUCT ID	OPTIONS ⁽¹⁾⁽²⁾
TPS7510x <i>yyyz</i>	X is the nominal default diode output current (for example, 3 = 3 mA, 5 = 5 mA, and 0 = 10 mA). YYY is the package designator. Z is the reel quantity (R = 3000, T = 250).

- (1) For the most current package and ordering information see the Package Option Addendum at the end of this document, or see the TI web site at www.ti.com.
- (2) Default set currents from 3 mA to 10 mA in 1-mA increments are available through the use of innovative factory EEPROM programming. Minimum order quantities may apply. Contact factory for details and availability.

11.2 Documentation Support

11.2.1 Related Documentation

For related documentation see the following:

11.5 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

TI E2E™ Online Community *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

11.6 Trademarks

E2E is a trademark of Texas Instruments.
All other trademarks are the property of their respective owners.

11.7 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

11.8 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package Pins	Package qty Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
TPS75100DSKR	Active	Production	SON (DSK) 10	3000 LARGE T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 85	SKX
TPS75100DSKT	Active	Production	SON (DSK) 10	250 SMALL T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 85	SKX
TPS75100YFFR	Active	Production	DSBGA (YFF) 9	3000 LARGE T&R	Yes	SNAGCU	Level-1-260C-UNLIM	-40 to 85	FB
TPS75100YFFT	Active	Production	DSBGA (YFF) 9	250 SMALL T&R	Yes	SNAGCU	Level-1-260C-UNLIM	-40 to 85	FB
TPS75103YFFR	Active	Production	DSBGA (YFF) 9	3000 LARGE T&R	Yes	SNAGCU	Level-1-260C-UNLIM	-40 to 85	FC
TPS75103YFFT	Active	Production	DSBGA (YFF) 9	250 SMALL T&R	Yes	SNAGCU	Level-1-260C-UNLIM	-40 to 85	FC
TPS75105DSKR	Active	Production	SON (DSK) 10	3000 LARGE T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 85	CHH
TPS75105DSKT	Active	Production	SON (DSK) 10	250 SMALL T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 85	CHH

TPS75105YFFT	Active	Production	DSBGA (YFF) 9	250 SMALL T&R	Yes	SNAGCU	Level-1-260C-UNLIM	-40 to 85	FE

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and

continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION
