Semiconductor Company

Not Recommended
for New Design

The information contained herein is subject to change without notice. 021023 _D

TOSHIBA is continually working to improve the quality and reliability of its products. Nevertheless, semiconductor devices in general can malfunction or fail due to their inherent electrical sensitivity and vulnerability to physical stress.

It is the responsibility of the buyer, when utilizing TOSHIBA products, to comply with the standards of safety in making a safe design for the entire system, and to avoid situations in which a malfunction or failure of such TOSHIBA products could cause loss of human life, bodily injury or damage to property.

In developing your designs, please ensure that TOSHIBA products are used within specified operating ranges as set forth in the most recent TOSHIBA products specifications.

Also, please keep in mind the precautions and conditions set forth in the "Handling Guide for Semiconductor Devices," or "TOSHIBA Semiconductor Reliability Handbook" etc. 021023_A

The Toshiba products listed in this document are intended for usage in general electronics applications (computer, personal equipment, office equipment, measuring equipment, industrial robotics, domestic appliances, etc.).

These Toshiba products are neither intended nor warranted for usage in equipment that requires extraordinarily high quality and/or reliability or a malfunction or failure of which may cause loss of human life or bodily injury ("Unintended Usage"). Unintended Usage include atomic energy control instruments, airplane or spaceship instruments, transportation instruments, traffic signal instruments, combustion control instruments, medical instruments, all types of safety devices, etc. Unintended Usage of Toshiba products listed in this document shall be made at the customer's own risk. 021023_B

The products described in this document shall not be used or embedded to any downstream products of which manufacture, use and/or sale are prohibited under any applicable laws and regulations. 060106_Q

The information contained herein is presented only as a guide for the applications of our products. No responsibility is assumed by TOSHIBA for any infringements of patents or other rights of the third parties which may result from its use. No license is granted by implication or otherwise under any patent or patent rights of TOSHIBA or others. 021023_C

The products described in this document may include products subject to the foreign exchange and foreign trade laws. 021023_F

For a discussion of how the reliability of microcontrollers can be predicted, please refer to Section 1.3 of the chapter entitled Quality and Reliability Assurance/Handling Precautions. 030619_S

Caution in Setting the UART Noise Rejection Time

When UART is used, settings of RXDNC are limited depending on the transfer clock specified by BRG. The combination "O" is available but please do not select the combination "-".

The transfer clock generated by timer/counter interrupt is calculated by the following equation :

$$\text{Transfer clock [Hz]} = \text{Timer/counter source clock [Hz]} \div \text{TTREG set value}$$

BRG setting	Transfer clock [Hz]	RXDNC setting			
		00 (No noise rejection)	01 (Reject pulses shorter than $31/f_c[s]$ as noise)	10 (Reject pulses shorter than $63/f_c[s]$ as noise)	11 (Reject pulses shorter than $127/f_c[s]$ as noise)
000	$f_c/13$	O	O	O	-
110 (When the transfer clock generated by timer/counter interrupt is the same as the right side column)	$f_c/8$	O	-	-	-
	$f_c/16$	O	O	-	-
	$f_c/32$	O	O	O	-
The setting except the above		O	O	O	O

Comparison table of TMP86C829B/H29B/M29B/PM29A/PM29B/C929AXB and TMP86FM29 Difference

	TMP86C829B TMP86CH29B TMP86CM29B	TMP86PM29A TMP86PM29B	TMP86C929AXB (Emulation chip) (Note 3)	TMP86FM29F
ROM	8 K (Mask ROM) 16 K (Mask ROM) 32 K (Mask ROM)	32 K (OTP)	–	32 K (Flash)
RAM	512 1.5 K 1.5 K	1.5 K	–	2 K
I/O	42 pin		42 pin (MCU part)	42 pin
External Interrupt	5 pin			5 pin
AD Converter	10-bit AD converter × 8 ch			10-bit AD converter × 8 ch
Timer Counter	18-bit timer × 1 ch 8-bit timer × 4 ch			18-bit timer × 1 ch 8-bit timer × 4 ch
Serial Interface	8-bit UART / SIO × 1 ch			8-bit UART / SIO × 1 ch
LCD	32 seg × 4 com			32 seg × 4 com (Note 2)
Key-on Wakeup	4 ch			4 ch
Operating Voltage in MCU Mode	1.8 to 5.5 V at 4.2 MHz 2.7 to 5.5 V at 8 MHz 4.5 to 5.5 V at 16 MHz		1.8 to 5.25 V at 4.2 MHz 2.7 to 5.25 V at 8 MHz 4.5 to 5.25 V at 16 MHz	1.8 to 3.6 V at 4.2 MHz (External clock) 1.8 to 3.6 V at 8 MHz (Resonator) 2.7 to 3.6 V at 16 MHz
Operating Temperature in MCU Mode	–40 to 85°C		0 to 60°C	–40 to 85°C
Writing to Flash Memory	–			2.7 to 3.6V at 16 MHz 25°C ± 5°C
CPU Wait (Note 1)	N/A			Available

Note 1: The CPU wait is a CPU halt function for stabilizing of power supply of Flash memory. The CPU wait period is as follows. In the CPU wait period except RESET, CPU is halted but peripheral functions are not halted. Therefore, if the interrupt occurs during the CPU wait period, the interrupt latch is set. In this case, if the IMF has been set to “1”, the interrupt service routine is executed after CPU wait period. For details refer to 2.14 “Flash Memory” in TMP86FM29 data sheet.

Thus, even if the same software is executed in 86FM29 and 86C829B/H29B/M29B/PM29A/PM29B/C929AXB, the operation process is not the same. Therefore, when the final operating confirmation on target application is executed for software development of Mask ROM Product (86C829B/H29B/M29B), not the Flash product (86FM29) but the OTP product (86PM29A/PM29B) should be used.

Condition	Wait Time	Halt/Operate	
		CPU	Peripherals
After reset release	$2^{10}/f_c[s]$	Halt	Halt
Changing from STOP mode to NORMAL mode (at EEPCCR<MNPWDW> = “1”)	$2^{10}/f_c[s]$	Halt	Operate
Changing from STOP mode to SLOW mode (at EEPCCR<MNPWDW> = “1”)	$2^3/f_s[s]$	Halt	Operate
Changing from IDLE0/1/2 mode to NORMAL mode (at EEPCCR<ATPWDW> = “0”)	$2^{10}/f_c[s]$	Halt	Operate
Changing from SLEEP0/1/2 mode to SLOW mode (at EEPCCR<ATPWDW> = “0”)	$2^3/f_s[s]$	Halt	Operate

Note 2: The 86FM29 can not drive the 5V LCD panel because the electrical characteristics in 86FM29 is altered from 86C829B/H29B/M29B/PM29A/PM29B/C929AXB. The recommended operating condition of V3 pin in TMP86FM29 is 3.6V(max). For details, refer to "Electrical Characteristics".

When the LCD booster circuit is used in 86FM29, connect the reference voltage and capacitor as shown in "case2". Though the method of "case1" has been recommended in 86C829B/H29B/M29B/PM29A/PM29B datasheets, the 86FM29 should not use method of "case1". Even if the method of "case1" is used in the 86C829B/H29B/M29B/PM29A/PM29B/C929AXB, the function and operation are not issue at all. However, if the "case2" is used, the booster ability becomes higher than "case1". Therefore, when the application board is designed newly in future, the method of "case2" is also recommended in 86C829B/H29B/M29B/PM29A/PM29B/C929AXB.

Note 3: Flash function, CPU wait period and serial PROM mode cannot be emulated in the 86C929AXB. If the software including the flash function is executed in 86C929AXB, the operation process differs from 86FM29.

CMOS 8-Bit Microcontroller

TMP86FM29UG/FG

The TMP86FM29 is the high-speed, high-performance and low power consumption 8-bit microcomputer, including FLASH, RAM, LCD driver, multi-function timer/counter, serial interface (UART/SIO), a 10-bit AD converter and two clock generators on chip.

Product No.	FLASH	RAM	Package	Emulation Chip
TMP86FM29UG	32768 × 8 bits	1536 × 8 bits	P-LQFP64-1010-0.50E	TMP86C929AXB
TMP86FM29FG			P-QFP64-1414-0.80C	

Features

- ◆ 8-bit single chip microcomputer TLCS-870/C series
- ◆ Instruction execution time: 0.25 μ s (at 16 MHz)
122 μ s (at 32.768 kHz)
- ◆ 132 types and 731 basic instructions
- ◆ 19 interrupt sources (External: 5, Internal: 14)
- ◆ Input/Output ports (39 pins)
(Out of which 24 pins are also used as SEG pins)
- ◆ 18-bit timer counter: 1 ch
 - Timer, Event counter,
Pulse width measurement,
Frequency measurement modes
- ◆ 8-bit timer counter: 4 ch
 - Timer, Event counter,
PWM output, Programmable divider output,
PPG output modes
- ◆ Time Base Timer
- ◆ Divider output function

- ◆ Watchdog Timer
 - Interrupt source/reset output (programmable)
- ◆ Serial interface
 - 8-bit UART/SIO: 1ch
- ◆ 10-bit successive approximation type AD converter
 - Analog input: 8 ch
- ◆ Four Key-On Wake-Up pins
- ◆ LCD driver/controller
 - Built-in voltage booster for LCD driver
 - With display memory
 - LCD direct drive capability (max 32 seg × 4 com)
 - 1/4, 1/3, 1/2 duties or static drive are programmably selectable
- ◆ Dual clock operation
 - Single/Dual-clock mode
- ◆ Nine power saving operating modes
 - STOP mode : Oscillation stops. Battery/Capacitor back-up. Port output hold/High-impedance.
 - SLOW 1, 2 mode : Low power consumption operation using low-frequency clock (32.768 kHz)
 - IDLE 0 mode : CPU stops, and peripherals operate using high-frequency clock of Time-Base-Timer. Release by falling edge of TBTCCR <TBTCK> setting.
 - IDLE 1 mode : CPU stops, and peripherals operate using high-frequency clock. Release by interrupts.
 - IDLE 2 mode : CPU stops, and peripherals operate using high and low frequency clock. Release by interrupts.
 - SLEEP 0 mode : CPU stops, and peripherals operate using low-frequency clock of Time-Base-Timer. Release by falling edge of TBTCCR <TBTCK> setting.
 - SLEEP 1 mode : CPU stops, and peripherals operate using low-frequency clock. Release by interrupts.
 - SLEEP 2 mode : CPU stops, and peripherals operate using high and low frequency clock. Release by interrupts.
- ◆ Wide operating voltage: 1.8 to 3.6 V at 8 MHz/32.768 kHz
2.7 to 3.6 V at 16 MHz/32.768 kHz

Block Diagram

Pin Functions

Pin Name	Input/Output	Functions		
P17 (SEG24, SCK)	I/O (I/O)	8-bit input/output port with latch. When used as input port, an external interrupt input, serial interface input/output and UART data input/output, the P1LCR must be set to "0" after setting output latch to "1". When used as a LCD segment output, the P1LCR must be set to "1".	Serial clock input/output	LCD segment outputs.
P16 (SEG25, TxD, SO)	I/O (Output)		UART data output	
P15 (SEG26, RxD, SI BOOT)	I/O (I/O)		Serial data output	
			UART data input	
			Serial data input	
P14 (SEG27, INT3)	I/O (I/O)		Serial PROM mode control input	
P13 (SEG28, INT2)	I/O (I/O)		External interrupt 3 input	
P12 (SEG29, INT1)	I/O (I/O)		External interrupt 2 input	
P11 (SEG30)	I/O (Output)	External interrupt 1 input		
P10 (SEG31)	I/O (Output)			
P22 (XTOUT)	I/O (Output)	3-bit input/output port with latch. When used as an input port, the output latch must be set to "1".	Resonator connecting pins (32.768 kHz) For inputting external clock, XTIN is used and XOUT is opened.	
P21 (XTIN)	I/O (Input)		External interrupt input 5 or STOP mode release signal input	
P20 (INT5 , STOP)	I/O (Input)			
P33 (PWM6 , PDO6 PPG6 , TC6)	I/O (I/O)	4-bit programmable input/output port (Nch high current output).	Timer counter 6 input/output	
P32 (PWM4 , PDO4 PPG4 , TC4)	I/O (I/O)	When used as a timer/counter output or divider output, the output latch must be set to "1". When used as an input port or timer/counter input, the P3OUTCR must be set to "0" after P3DR is set to "1".	Timer counter 4 input/output	
P31 (PWM3 , PDO3 , TC3)	I/O (I/O)		Timer counter 3 input/output	
P30 (DVO)	I/O (Output)		Divider output	
P57 (SEG16) to P50 (SEG23)	I/O (Output)	8-bit input/output port with latch. When used as a LCD segment output, the P5LCR must be set to "1".	LCD segment outputs	
P67 (AIN7, STOP5)	I/O (Input)	8-bit programmable input/output port (tri-state). Each bit of this port can be individually configured as an input or an output under software control. When used as an analog input, the P6CR must be set to "0" after setting output latch to "0". When used as an input port, a key on wake up input, an external interrupt input and timer/counter input, the P6CR must be set to "0" after setting output latch to "1".	STOP 5 input	AD converter analog inputs
P66 (AIN6, STOP4)	I/O (Input)		STOP 4 input	
P65 (AIN5, STOP3)	I/O (Input)		STOP 3 input	
P64 (AIN4, STOP2)	I/O (Input)		STOP 2 input	
P63 (AIN3, INT0)	I/O (Input)		External interrupt 0 input	
P62 (AIN2, ECNT)	I/O (Input)		Timer/Counter 1 input	
P61 (AIN1, ECIN)	I/O (Input)			
P60 (AIN0)	I/O (Input)			
P77 (SEG8) to P70 (SEG15)	I/O (Output)	8-bit input/output port with latch. When used as a LCD segment output, the P7LCR must be set to "1".	LCD segment outputs	
SEG7 to SEG0	Output	LCD segment outputs		
COM3 to COM0		LCD common outputs		
V3 to V1	LCD voltage booster pin	LCD voltage booster pin.		
C1 to C0		Capacitors are required between C0 and C1 pin and V1/V2/V3 pin and GND.		
XIN, XOUT	Input Output	Resonator connecting pins for high-frequency clock. For inputting external clock, XIN is used and XOUT is opened.		
RESET	I/O	Reset signal input or watchdog timer output/address-trap-reset output/system clock reset output		
TEST	Input	Test pin for out-going test, and the serial PROM mode control pin. Usually be fixed to low level. When the serial PROM mode starts, be fixed to "1".		
VDD, VSS	Power Supply	+5 V, 0 (GND)		
VAREF		Analog reference voltage inputs (High)		
AVDD		AD circuit power supply		

Operational Description

1. CPU Core Functions

The CPU core consists of a CPU, a system clock controller, and an interrupt controller.

This section provides a description of the CPU core, the program memory, the data memory, the external memory interface, and the reset circuit.

1.1 Memory Address Map

The TMP86FM29 memory consists of 5 blocks: FLASH memory, BOOT ROM, RAM, DBR (Data buffer register) and SFR (Special function register). They are all mapped in 64-Kbyte address space. Figure 1.1.1 shows the TMP86FM29 memory address map. The general-purpose registers are not assigned to the RAM address space.

Figure 1.1.1 Memory Address Maps

1.2 Program Memory (FLASH)

The TMP86FM29 has a 32 K × 8 bits (Address 8000H to FFFFH) of Flash memory.

1.3 Data Memory (RAM)

The TMP86FM29 has 1536 bytes of internal RAM. The first 192 bytes (0040H to 00FFH) of the internal RAM are located in the direct area; instructions with shorten operations are available against such an area.

The data memory contents become unstable when the power supply is turned on; therefore, the data memory should be initialized by an initialization routine.

Example: Clears RAM to "00H".

```
LD      HL, 0040H      ; Start address setup
LD      A, H           ; Initial value (00H) setup
LD      BC, 05FFH      ;
SRAMCLR: LD      (HL), A
INC     HL
DEC     BC
JRS     F, SRAMCLR
```

1.4 System Clock Controller

The system clock controller consists of a clock generator, a timing generator, and a standby controller.

Figure 1.4.1 System Clock Control

1.4.1 Clock Generator

The clock generator generates the basic clock which provides the system clocks supplied to the CPU core and peripheral hardware. It contains two oscillation circuits: one for the high-frequency clock and one for the low-frequency clock. Power consumption can be reduced by switching of the standby controller to low-power operation based on the low-frequency clock.

The high-frequency (**fc**) and low-frequency (**fs**) clocks can easily be obtained by connecting a resonator between the **XIN/XOUT** and **XTIN/XTOUT** pins respectively. Clock input from an external oscillator is also possible. In this case, external clock is applied to **XIN/XTIN** pin with **XOUT/XTOUT** pin not connected.

Figure 1.4.2 Examples of Resonator Connection

Note: The function to monitor the basic clock directly at external is not provided for hardware, however, with disabling all interrupts and watchdog timers, the oscillation frequency can be adjusted by monitoring the pulse which the fixed frequency is outputted to the port by the program.

The system to require the adjustment of the oscillation frequency should create the program for the adjustment in advance.

1.4.2 Timing Generator

The timing generator generates the various system clocks supplied to the CPU core and peripheral hardware from the basic clock (fc or fs). The timing generator provides the following functions.

- Generation of main system clock
- Generation of divider output ($\overline{DVO}$) pulses
- Generation of source clocks for time base timer
- Generation of source clocks for watchdog timer
- Generation of internal source clocks for timer/counters and serial interface
- Generation of warm-up clocks for releasing STOP mode

(1) Configuration of timing generator

The timing generator consists of a 2-stage prescaler, a 21-stage divider, a main system clock generator, and machine cycle counters.

An input clock to the 7th stage of the divider depends on the operating mode, $TBTCR<DV7CK>$, that is shown in Figure 1.4.4. As reset and STOP mode started/canceled, the prescaler and the divider are cleared to “0”.

Figure 1.4.3 Configuration of Timing Generator

Figure 1.4.4 Timing Generator Control Register

(2) Machine cycle

Instruction execution and peripheral hardware operation are synchronized with the main system clock.

The minimum instruction execution unit is called an "machine cycle". There are a total of 10 different types of instructions for the TLCS-870/C series: ranging from 1-cycle instructions which require one machine cycle for execution to 10-cycle instructions which require 10 machine cycles for execution.

A machine cycle consists of 4 states (S0 to S3), and each state consists of one main system clock.

Figure 1.4.5 Machine Cycle

1.4.3 Operation Mode Control Circuit

The operation mode control circuit starts and stops the oscillation circuits for the high-frequency and low-frequency clocks, and switches the main system clock. There are two operating modes: single-clock and dual-clock. These modes are controlled by the system control registers (SYSCR1 and SYSCR2).

Figure 1.4.6 shows the operating mode transition diagram and Figure 1.4.7 shows the system control registers.

(1) Single-clock mode

Only the oscillation circuit for the high-frequency clock is used, and P21 (XTIN) and P22 (XTOUT) pins are used as input/output ports. The main-system clock is obtained from the high-frequency clock. In the single-clock mode, the machine cycle time is $4/f_c$ [s].

a. NORMAL1 mode

In this mode, both the CPU core and on-chip peripherals operate using the high-frequency clock.

The TMP86FM29 is placed in this mode after reset.

b. IDLE1 mode

In this mode, the internal oscillation circuit remains active. The CPU and the watchdog timer are halted; however on-chip peripherals remain active (Operate using the high-frequency clock).

IDLE1 mode is started by SYSCR2<IDLE>, and IDLE1 mode is released to NORMAL1 mode by an interrupt request from the on-chip peripherals or external interrupt inputs. When the IMF (Interrupt master enable flag) is "1" (Interrupt enable), the execution will resume with the acceptance of the interrupt, and the operation will return to normal after the interrupt service is completed. When the IMF is "0" (Interrupt disable), the execution will resume with the instruction which follows the IDLE1 mode start instruction.

c. IDLE0 mode

In this mode, all the circuit, except oscillator and the time-base-timer, stops operation.

This mode is enabled by setting "1" on bit TGHALT on the system control register 2 (SYSCR2).

When IDLE0 mode starts, the CPU stops and the timing generator stops feeding the clock to the peripheral circuits other than TBT. Then, upon detecting the falling edge of the source clock selected with TBTCCR<TBTCK>, the timing generator starts feeding the clock to all peripheral circuits.

When returned from IDLE0 mode, the CPU restarts operating, entering NORMAL1 mode back again. IDLE0 mode is entered and returned regardless of how TBTCCR<TBTEN> is set. When IMF = "1", EF6 (TBT interrupt individual enable flag) = "1", and TBTCCR<TBTEN> = "1", interrupt processing is performed. When IDLE0 mode is entered while TBTCCR<TBTEN> = "1", the INTTBT interrupt latch is set after returning to NORMAL1 mode.

(2) Dual-clock mode

Both the high-frequency and low-frequency oscillation circuits are used in this mode. P21 (XTIN) and P22 (XTOUT) pins cannot be used as input/output ports. The main system clock is obtained from the high-frequency clock in NORMAL2 and IDLE2 modes, and is obtained from the low-frequency clock in SLOW and SLEEP modes. The machine cycle time is $4/f_c$ [s] in the NORMAL2 and IDLE2 modes, and $4/f_s$ [s] ($122\ \mu\text{s}$ at $f_s = 32.768\ \text{kHz}$) in the SLOW and SLEEP modes.

The TLCS-870/C is placed in the single-clock mode during reset. To use the dual-clock mode, the low-frequency oscillator should be turned on at the start of a program.

a. NORMAL2 mode

In this mode, the CPU core operates with the high-frequency clock. On-chip peripherals operate using the high-frequency clock and/or low-frequency clock.

b. SLOW2 mode

In this mode, the CPU core operates with the low-frequency clock, while both the high-frequency clock and the low-frequency clock are operated. On-chip peripherals are triggered by the low-frequency clock. As the SYSCK on SYSCR2 becomes "0", the hardware changes into NORMAL2 mode. As the XEN on SYSCR2 becomes "0", the hardware changes into SLOW1 mode. Do not clear XTEN to "0" during SLOW2 mode.

c. SLOW1 mode

This mode can be used to reduce power consumption by turning off oscillation of the high-frequency clock. The CPU core and on-chip peripherals operate using the low-frequency clock.

Switching back and forth between SLOW1 and SLOW2 modes are performed by XEN bit on the system control register 2 (SYSCR2). In SLOW1 and SLEEP mode, the input clock to the 1st stage of the divider is stopped; output from the 1st to 6th stages is also stopped.

d. IDLE2 mode

In this mode, the internal oscillation circuit remain active. The CPU and the watchdog timer are halted; however, on-chip peripherals remain active (Operate using the high-frequency clock and/or the low-frequency clock). Starting and releasing of IDLE2 mode are the same as for IDLE1 mode, except that operation returns to NORMAL2 mode.

e. SLEEP1 mode

In this mode, the internal oscillation circuit of the low-frequency clock remains active. The CPU, the watchdog timer, and the internal oscillation circuit of the high-frequency clock are halted; however, on-chip peripherals remain active (Operate using the low-frequency clock). Starting and releasing of SLEEP mode are the same as for IDLE1 mode, except that operation returns to SLOW mode. In SLOW and SLEEP mode, the input clock to the 1st stage of the divider is stopped; output from the 1st to 6th stages is also stopped.

f. SLEEP2 mode

The SLEEP2 mode is the IDLE mode corresponding to the SLOW2 mode. The status under the SLEEP2 mode is same as that under the SLEEP1 mode, except for the oscillation circuit of the high-frequency clock.

g. SLEEP0 mode

In this mode, all the circuit, except oscillator and the time-base-timer, stops operation.

This mode is enabled by setting “1” on bit TGHALT on the system control register 2 (SYSCR2).

When SLEEP0 mode starts, the CPU stops and the timing generator stops feeding the clock to the peripheral circuits other than TBT. Then, upon detecting the falling edge of the source clock selected with TBTCCR<TBTCK>, the timing generator starts feeding the clock to all peripheral circuits.

When returned from SLEEP0 mode, the CPU restarts operating, entering SLOW1 mode back again. SLEEP0 mode is entered and returned regardless of how TBTCCR<TBTEN> is set. When IMF = “1”, EF6 (TBT interrupt individual enable flag) = “1”, and TBTCCR<TBTEN> = “1”, interrupt processing is performed. When SLEEP0 mode is entered while TBTCCR<TBTEN> = “1”, the INTTBT interrupt latch is set after returning to SLOW1 mode.

(3) STOP mode

In this mode, the internal oscillation circuit is turned off, causing all system operations to be halted. The internal status immediately prior to the halt is held with a lowest power consumption during STOP mode.

STOP mode is started by the system control register 1 (SYSCR1), and STOP mode is released by a inputting (either level-sensitive or edge-sensitive can be programmably selected) to the STOP pin or key on wake up pin input which is enabled by STOPCR. After the warm-up period is completed, the execution resumes with the instruction which follows the STOP mode start instruction.

Note 1: When the IDLE0/1/2 and SLEEP0/1/2 modes are started with the EEPCCR<ATPWDW> = “0”, the CPU wait period for stabilizing of the power supply of Flash control circuit is executed after being released from these mode.

Note 2: When the STOP mode is started with the EEPCCR<MNPWDW> = “1”, the CPU wait period for stabilizing of the power supply of Flash control circuit is executed after in the STOP warm-up time.

System Control Register 1

SYSCR1

(0038H)

7	6	5	4	3	2	1	0
STOP	RELM	RETM	OUTEN	WUT			

(Initial value: 0000 00**)

STOP	STOP mode start	0: CPU core and peripherals remain active 1: CPU core and peripherals are halted (Start STOP mode)			R/W
RELM	Release method for STOP pin (P20)	0: Edge-sensitive release 1: Level-sensitive release			
RETM	Operating mode after STOP mode	0: Return to NORMAL1/2 mode 1: Return to SLOW1 mode			
OUTEN	Port output during STOP mode	0: High impedance 1: Output kept			
WUT	Warm-up time at releasing STOP mode (Note 8)		Return to NORMAL mode	Return to SLOW mode	
		00	$3 \times 2^{16}/f_c + (2^{10}/f_c)$	$3 \times 2^{13}/f_s + (2^3/f_s)$	
		01	$2^{16}/f_c + (2^{10}/f_c)$	$2^{13}/f_s + (2^3/f_s)$	
		10	$3 \times 2^{14}/f_c + (2^{10}/f_c)$	$3 \times 2^9/f_s + (2^3/f_s)$	
		11	$2^{14}/f_c + (2^{10}/f_c)$	$2^6/f_s + (2^3/f_s)$	

Note 1: Always set RETM to "0" when transiting from NORMAL mode to STOP mode. Always set RETM to "1" when transiting from SLOW mode to STOP mode.

Note 2: When STOP mode is released with $\overline{\text{RESET}}$ pin input, a return is made to NORMAL1 regardless of the RETM contents.

Note 3: f_c : High-frequency clock [Hz], f_s : Low-frequency clock [Hz], *: Don't care

Note 4: Bits 1 and 0 in SYSCR1 are read as undefined data when a read instruction is executed.

Note 5: As the hardware becomes STOP mode under OUTEN = "0", input value is fixed to "0"; therefore it may cause interrupt request on account of falling edge.

Note 6: When the key-on wake-up input (STOP2 to STOP5) is used, RELM should be set to "1".

Note 7: Port P20 is used as $\overline{\text{STOP}}$ pin. Therefore, when stop mode is started, OUTEN does not affect to P20, and P20 becomes High-Z mode.

Note 8: When the STOP mode is started with the $\text{EEPCR} \langle \text{MNPWDW} \rangle = "1"$, the CPU wait period for stabilizing of the power supply of Flash control circuit is executed after in the STOP warm-up time.
(The CPU wait period for FLASH is shown in parentheses)

System Control Register 2

SYSCR2

(0039H)

7	6	5	4	3	2	1	0
XEN	XTEN	SYSCK	IDLE		TGHALT		

(Initial value: 1000 *0**)

XEN	High-frequency oscillator control	0: Turn off oscillation 1: Turn on oscillation	R/W
XTEN	Low-frequency oscillator control	0: Turn off oscillation 1: Turn on oscillation	
SYSCK	Main system clock select (write)/main system clock monitor (read)	0: High-frequency clock 1: Low-frequency clock	
IDLE	CPU and watchdog timer control (IDLE1/2, SLEEP1/2 mode)	0: CPU and watchdog timer remain active 1: CPU and watchdog timer are stopped (start IDLE1/2, SLEEP1/2 mode)	
TGHALT	TG control (IDLE0, SLEEP0 mode)	0: Feeding clock to all peripherals from TG 1: Stop feeding clock to peripherals except TBT from TG. (Start IDLE0, SLEEP0 mode)	

Note 1: A reset is applied ($\overline{\text{RESET}}$ pin output goes low) if both XEN and XTEN are cleared to "0", XEN is cleared to "0" when SYSCK = "0", or XTEN is cleared to "0" when SYSCK = "1".

Note 2: *: Don't care, TG: Timing generator

Note 3: Bits 3, 1 and 0 in SYSCR2 are always read as undefined value.

Note 4: Do not set IDLE and TGHALT to "1" simultaneously.

Note 5: Because returning from IDLE0/SLEEP0 to NORMAL1/SLOW1 is executed by the asynchronous internal clock, the period of IDLE0/SLEEP0 mode might be shorter than the period setting by $\text{TBTCTCR} \langle \text{TBTCK} \rangle$.

Note 6: When IDLE1/2 or SLEEP1/2 mode is released, IDLE is automatically cleared to "0".

Note 7: When IDLE0 or SLEEP0 mode is released, TGHALT is automatically cleared to "0".

Note 8: Before setting TGHALT to "1", be sure to stop peripherals. If peripherals are not stopped, the interrupt latch of peripherals may be set after IDLE0 or SLEEP0 mode is released.

Figure 1.4.7 System Control Registers

1.4.4 Operating Mode Control

(1) STOP mode

STOP mode is controlled by the system control register 1, the $\overline{\text{STOP}}$ pin input and key-on wake-up input (STOP2 to STOP5) which is controlled by the STOP mode release control register (STOPCR).

The $\overline{\text{STOP}}$ pin is also used both as a port P20 and an $\overline{\text{INT5}}$ (External interrupt input 5) pin.

STOP mode is started by setting SYSCR1<STOP> to "1". During STOP mode, the following status is maintained.

- a. Oscillations are turned off, and all internal operations are halted.
- b. The data memory, registers, the program status word and port output latches are all held in the status in effect before STOP mode was entered.
- c. The prescaler and the divider of the timing generator are cleared to "0".
- d. The program counter holds the address 2 ahead of the instruction (e.g. [SET (SYSCR1).7]) which started STOP mode.

STOP mode includes a level-sensitive mode and an edge-sensitive mode, either of which can be selected with the SYSCR1<RELM>. Do not use any STOPx (x: 2 to 5) pin input for releasing STOP mode in edge-sensitive mode.

When the STOP mode is started with the EEPCCR<MNPWDW> = "1", the CPU wait period for stabilizing of the power supply of Flash control circuit is executed after in the STOP warming-up time.

Note 1: The STOP mode can be released by either the STOP or key-on wake-up pin (STOP2 to STOP5). However, because the $\overline{\text{STOP}}$ pin is different from the key-on wake-up and can not inhibit the release input, the $\overline{\text{STOP}}$ pin must be used for releasing STOP mode.

Note 2: During stop period (from start of STOP mode to end of warm-up), due to changes in the external interrupt pin signal, interrupt latches may be set to "1" and interrupts may be accepted immediately after STOP mode is released. Before starting STOP mode, therefore, disable interrupts. Also, before enabling interrupts after STOP mode is released, clear unnecessary interrupt latches.

a. Level-sensitive release mode (RELM = "1")

In this mode, STOP mode is released by setting the $\overline{\text{STOP}}$ pin high or setting the STOPx (x: 2 to 5) pin input which is enabled by STOPCR. This mode is used for capacitor back-up when the main power supply is cut off and long term battery back-up.

When the $\overline{\text{STOP}}$ pin input is high, executing an instruction which starts STOP mode will not place in STOP mode but instead will immediately start the release sequence (Warm-up). Thus, to start STOP mode in the level-sensitive release mode, it is necessary for the program to first confirm that the $\overline{\text{STOP}}$ pin input is low. The following two methods can be used for confirmation.

- a. Testing a port P20.
- b. Using an external interrupt input $\overline{\text{INT5}}$ ($\overline{\text{INT5}}$ is a falling edge-sensitive input).

Example 1: Starting STOP mode from NORMAL mode by testing a port P20.

```

LD      (SYSCR1), 01010000B ; Sets up the level-sensitive release mode
SSTOPH: TEST  (P2PRD). 0      ; Wait until the  $\overline{\text{STOP}}$  pin input goes low
                                      level
JRS     F, SSTOPH
SET     (SYSCR1).7            ; Starts STOP mode

```

Example 2: Starting STOP mode from NORMAL mode with an INT5 interrupt.

```

PINT5:  TEST  (P2PRD). 0      ; To reject noise, STOP mode does not
                                      start if port P20 is at high
JRS     F, SINT5
LD      (SYSCR1), 01010000B ; Sets up the level-sensitive release mode.
SET     (SYSCR1). 7          ; Starts STOP mode
SINT5:  RETI

```

Figure 1.4.8 Level-sensitive Release Mode

Note 1: Even if the $\overline{\text{STOP}}$ pin input is low after warming up start, the STOP mode is not restarted.

Note 2: In this case of changing to the level-sensitive mode from the edge-sensitive mode, the release mode is not switched until a rising edge of the $\overline{\text{STOP}}$ pin input is detected.

b. Edge-sensitive release mode (RELM = "0")

In this mode, STOP mode is released by a rising edge of the $\overline{\text{STOP}}$ pin input. This is used in applications where a relatively short program is executed repeatedly at periodic intervals. This periodic signal (For example, a clock from a low-power consumption oscillator) is input to the STOP pin. In the edge-sensitive release mode, STOP mode is started even when the $\overline{\text{STOP}}$ pin input is high level. Do not use any STOPx (x: 2 to 5) pin input for releasing STOP mode in edge-sensitive release mode.

Example: Starting STOP mode from NORMAL mode

```

LD      (SYSCR1), 10010000B ; Starts after specified to the edge-sensitive
                                      release mode

```

Figure 1.4.9 Edge-sensitive Release Mode

STOP mode is released by the following sequence.

- In the dual-clock mode, when returning to NORMAL2, both the high-frequency and low-frequency clock oscillators are turned on; when returning to SLOW1 mode, only the low-frequency clock oscillator is turned on. In the single-clock mode, only the high-frequency clock oscillator is turned on.
- A STOP warm-up period is inserted to allow oscillation time to stabilize. During STOP warm-up, all internal operations remain halted. Four different STOP warm-up times can be selected with the SYSCR1<WUT> in accordance with the resonator characteristics.
- When the EEPCR<MNPWDW> is "1", the CPU wait period is inserted to stabilize the power supply of Flash control circuit. During CPU wait, though CPU operations remain halted, the peripheral function operation is resumed, and the counting of the timing generator is restarted. After the CPU wait is finished, normal operation resumes with the instruction following the STOP mode start instruction.
- When the EEPCR<MNPWDW> is "0", normal operation resumes with the instruction following the STOP mode start instruction after the STOP Warm-up.

Note 1: When the STOP mode is released, the start is made after the prescaler and the divider of the timing generator are cleared to "0".

Note 2: STOP mode can also be released by inputting low level on the $\overline{\text{RESET}}$ pin, which immediately performs the normal reset operation.

Note 3: When STOP mode is released with a low hold voltage, the following cautions must be observed.

The power supply voltage must be at the operating voltage level before releasing STOP mode. The $\overline{\text{RESET}}$ pin input must also be "H" level, rising together with the power supply voltage. In this case, if an external time constant circuit has been connected, the $\overline{\text{RESET}}$ pin input voltage will increase at a slower pace than the power supply voltage. At this time, there is a danger that a reset may occur if input voltage level of the $\overline{\text{RESET}}$ pin drops below the non-inverting high-level input voltage (Hysteresis input).

Table 1.4.1 Warm-up Time Example (at $f_c = 16.0$ MHz, $f_s = 32.768$ kHz)

WUT	Warm-up Time [ms] (Note 2)	
	Return to NORMAL Mode	Return to SLOW Mode
00	$12.288 + (0.064)$	$750 + (0.244)$
01	$4.096 + (0.064)$	$250 + (0.244)$
10	$3.072 + (0.064)$	$5.85 + (0.244)$
11	$1.024 + (0.064)$	$1.95 + (0.244)$

Note 1: The warm-up time is obtained by dividing the basic clock by the divider: therefore, the warm-up time may include a certain amount of error if there is any fluctuation of the oscillation frequency when STOP mode is released. Thus, the warm-up time must be considered an approximate value.

Note 2: The CPU wait period for FLASH is shown in parentheses.

Not Recommended for New Design

Figure 1.4.10 STOP Mode Start/Release (When EEPCR<MNPWDW> = "0")

Figure 1.4.11 STOP Mode Start/Release (When EEPCr<MNPWDW> = "1")

(2) IDLE1/2 mode, SLEEP1/2 mode

IDLE1/2 and SLEEP1/2 modes are controlled by the system control register 2 (SYSCR2) and maskable interrupts. The following status is maintained during these modes.

- a. Operation of the CPU and watchdog timer (WDT) is halted. On-chip peripherals continue to operate.
- b. The data memory, CPU registers, program status word and port output latches are all held in the status in effect before these modes were entered.
- c. The program counter holds the address 2 ahead of the instruction which starts these modes.

Figure 1.4.12 IDLE1/2, SLEEP1/2 Modes

- Start the IDLE1/2 and SLEEP1/2 modes

When IDLE1/2 and SLEEP1/2 modes start, set SYSCR2<IDLE> to “1”.

- Release the IDLE1/2 and SLEEP1/2 modes

IDLE1/2 and SLEEP1/2 modes include a normal release mode and an interrupt release mode. These modes are selected by interrupt master enable flag (IMF).

After releasing IDLE1/2 and SLEEP1/2 modes, the SYSCR2<IDLE> is automatically cleared to “0” and the operation mode is returned to the mode preceding IDLE1/2 and SLEEP1/2 modes.

When the IDLE1/2 and SLEEP1/2 modes are started with the EEP CR<ATPWDW> = “0”, the CPU wait period for stabilizing of the power supply of Flash control circuit is added before the operation mode is returned to the preceding modes. The CPU wait time of IDLE1/2 is $2^{10}/f_c$ [s] and that of SLEEP1/2 mode is $2^3/f_s$ [s].

IDLE1/2 and SLEEP1/2 modes can also be released by inputting low level on the $\overline{\text{RESET}}$ pin. After releasing reset, the operation mode is started from NORMAL1 mode.

Note: During CPU wait, though CPU operations remain halted, but the peripheral function operation is resumed. Therefore in this time, though the interrupt latch might be set, interrupt operation is not executed until the CPU wait is finished.

(a) Normal release mode (IMF = “0”)

IDLE1/2 and SLEEP1/2 modes are released by any interrupt source enabled by the individual interrupt enable flag (EF). After the interrupt is generated, the program operation is resumed from the instruction following the IDLE1/2 and SLEEP1/2 modes start instruction. Normally, the interrupt latches (IL) of the interrupt source used for releasing must be cleared to “0” by load instructions.

(b) Interrupt release mode (IMF = “1”)

IDLE1/2 and SLEEP1/2 modes are released by any interrupt source enabled with the individual interrupt enable flag (EF). After the interrupt is processed, the program operation is resumed from the instruction following the instruction, which starts IDLE1/2 and SLEEP1/2 modes.

Note: When a watchdog timer interrupts is generated immediately before IDLE1/2 and SLEEP1/2 mode are started, the watchdog timer interrupt will be processed but IDLE1/2 and SLEEP1/2 mode will not be started.

Figure 1.4.13 IDLE1/2, SLEEP1/2 Mode Start/Release

(3) IDLE0, SLEEP0 mode (IDLE0, SLEEP0)

IDLE0 and SLEEP0 modes are controlled by the system control register 2 (SYSCR2) and the time base timer control register (TBTCCR). The following status is maintained during IDLE0 and SLEEP0 modes.

- Timing generator stops feeding clock to peripherals except TBT.
- The data memory, CPU registers, program status word and port output latches are all held in the status in effect before IDLE0 and SLEEP0 modes were entered.
- The program counter holds the address 2 ahead of the instruction which starts IDLE0 and SLEEP0 modes.

Note: Before starting IDLE0 or SLEEP0 mode, be sure to stop (Disable) peripherals.

Figure 1.4.14 IDLE0, SLEEP0 Mode

- Start the IDLE0 and SLEEP0 modes
Stop (Disable) peripherals such as a timer counter.
When IDLE0 and SLEEP0 modes start, set SYSCR2<TGHALT> to “1”.
- Release the IDLE0 and SLEEP0 modes
IDLE0 and SLEEP0 modes include a normal release mode and an interrupt release mode.
These modes are selected by interrupt master flag (IMF), individual interrupt enable-flag (EF6) for INTTBT and TBTCCR<TBTEN>
After releasing IDLE0 and SLEEP0 modes, the SYSCR2<TGHALT> is automatically cleared to “0” and the operation mode is returned to the mode preceding IDLE0 and SLEEP0 modes. Before starting the IDLE0 or SLEEP0 mode, when the TBTCCR<TBTEN> is set to “1”, INTTBT interrupt latch is set to “1”.
When the IDLE0 and SLEEP0 modes are started with the EEPCCR<ATPWDW> = “0”, the CPU wait period for stabilizing of the power supply of Flash control circuit is added before the operation mode is returned to the preceding modes. The CPU wait time of IDLE0 is $2^{10}/f_c$ [s] and that of SLEEP0 mode is $2^3/f_s$ [s].
IDLE0 and SLEEP0 modes can also be released by inputting low level on the RESET pin. After releasing reset, the operation mode is started from NORMAL1 mode.

Note 1: IDLE0 and SLEEP0 modes start/release without reference to TBTCCR<TBTEN> setting.

Note 2: During CPU wait, though CPU operations remain halted, but the peripheral function operation is resumed. Therefore in this time, though the interrupt latch might be set, interrupt operation is not executed until the CPU wait is finished.

a. Normal release mode (IMF • EF6 • TBTCCR<TBTEN> = “0”)

IDLE0 and SLEEP0 modes are released by the source clock falling edge, which is setting by the TBTCCR<TBTCK>. After the falling edge is detected, the program operation is resumed from the instruction following the IDLE0 and SLEEP0 modes start instruction.

b. Interrupt release mode (IMF • EF6 • TBTCCR<TBTEN> = “1”)

IDLE0 and SLEEP0 modes are released by the source clock falling edge, which is setting by the TBTCCR<TBTCK> and INTTBT interrupt processing is started.

Note 1: Because returning from IDLE0, SLEEP0 to NORMAL1, SLOW1 is executed by the asynchronous internal clock, the period of IDLE0, SLEEP0 mode might be the shorter than the period setting by TBTCCR<TBTCK>.

Note 2: When a watchdog timer interrupt is generated immediately before IDLE0/SLEEP0 mode is started, the watchdog timer interrupt will be processed but IDLE0/SLEEP0 mode will not be started.

Figure 1.4.15 IDLE0, SLEEP0 Mode Start/Release

(4) SLOW mode

SLOW mode is controlled by the system control register 2 (SYSCR2).

The following is the methods to switch the mode with the warm-up counter (TC2).

a. Switching from NORMAL2 mode to SLOW1 mode

First, set SYSCR2<SYSCK> to switch the main system clock to the low-frequency clock for SLOW2 mode.

Next, clear SYSCR2<XEN> to turn off high-frequency oscillation.

Note: The high-frequency clock oscillation can be continued to return quickly to NORMAL2 mode. But starting STOP mode while SLOW mode, the high-frequency oscillation must be stopped.

When the low-frequency clock oscillation is unstable, wait until oscillation stabilizes before performing the above operations. The timer/counter 2 (TC2) can conveniently be used to confirm that low-frequency clock oscillation has stabilized.

Example 1: Switching from NORMAL2 mode to SLOW1 mode.

```

SET      (SYSCR2). 5      ; SYSCR2<SYSCK> ← 1
                          ; (Switches the main system clock to the
                          ; low-frequency clock for SLOW2)
CLR      (SYSCR2). 7      ; SYSCR2<XEN> ← 0
                          ; (Turns off high-frequency oscillation)

```

Example2: Switching to the SLOW1 mode after low-frequency clock has stabilized.

```

SET      (SYSCR2). 6      ; SYSCR2<XTEN> ← 1
LD       (TC2CR), 14H      ; Sets mode for TC2
LDW      (TC2DRL), 8000H   ; Sets warm-up time
                          ; (Depend on oscillator accompanied)
DI       ; IMF ← 0
SET      (EIRE). 4        ; Enables INTTC2
EI       ; IMF ← 1
SET      (TC2CR). 5       ; Starts TC2
...
PINTTC2: CLR      (TC2CR). 5 ; Stops TC2
          SET      (SYSCR2). 5 ; SYSCR2<SYSCK> ← 1
                          ; (Switches the main system clock to the
                          ; low-frequency clock)
          CLR      (SYSCR2). 7 ; SYSCR2<XEN> ← 0
                          ; (Turns off high-frequency oscillation)
          RETI
          ...
VINTTC2: DW      PINTTC2    ; INTTC2 vector table

```

b. Switching from SLOW1 mode to NORMAL2 mode

First, set SYSCR2<XEN> to turn on the high-frequency oscillation. When time for stabilization (Warm-up) has been taken by the timer/counter 2 (TC2), clear SYSCR2<SYSCK> to switch the main system clock to the high-frequency clock.

Note 1: After SYSCK is cleared to "0", executing the instructions is continued by the low-frequency clock for the period synchronized with low-frequency and high-frequency clocks.

Note 2: SLOW mode can also be released by inputting low level on the $\overline{\text{RESET}}$ pin, which immediately performs the reset operation. After reset, the TMP86FM29 is placed in NORMAL1 mode.

Example: Switching from the SLOW1 mode to the NORMAL2 mode

($f_c = 16 \text{ MHz}$, warm-up time $t_s = 4.0 \text{ ms}$).

```

SET      (SYSCR2). 7      ; SYSCR2<XEN> ← 1
                          ; (Starts high-frequency oscillation)

LD       (TC2CR). 10H     ; Sets mode for TC2
                          ; (Timer mode,  $f_c$  for source)

LD       (TC2DRH). 0F8H   ; Sets warm-up time
                          ; (Depend on oscillator accompanied)

DI       ; IMF ← 0
SET      (EIRE). 4        ; Enables INTTC2
EI       ; IMF ← 1
SET      (TC2CR). 5       ; Starts TC2
;
PINTTC2: CLR      (TC2CR). 5 ; Stops TC2
          CLR      (SYSCR2). 5 ; SYSCR2<SYSCK> ← 0
                          ; (Switches the main system clock to the
                          ; high-frequency clock)

          RETI
          ;
VINTTC2: DW      PINTTC2   ; INTTC2 vector table
  
```

Figure 1.4.16 Switching between the NORMAL2 and SLOW Modes

1.5 Interrupt Control Circuit

The TMP86FM29 has a total (Reset is excluded) of 15 interrupt sources for 19 interrupt factors; 3 of the sources are multiplexed. Multiple interrupt with priorities is available. 4 of the internal factors are non-maskable interrupts, and the rest of them are maskable interrupts.

Interrupt sources are provided with interrupt latches (IL), which hold interrupt requests, and independent vectors. The interrupt latch is set to “1” by the generation of its interrupt request which requests the CPU to accept its interrupts. Interrupts are enabled or disabled by software using the interrupt master enable flag (IMF) and interrupt enable flag (EF). If more than one interrupts are generated simultaneously, interrupts are accepted in order which is dominated by hardware. However, there are no prioritized interrupt factors among non-maskable interrupts.

Table 1.5.1 Interrupt Sources

Interrupt Factors		Enable Condition	Interrupt Latch	Vector Address	Priority
Internal/External	(Reset)	Non-maskable	–	FFFE _H	High 1
Internal	INTSWI (Software interrupt)	Non-maskable	–	FFFC _H	2
Internal	INTUNDEF (Executed the Undefined Instruction interrupt)	Non-maskable	–	FFFC _H	2
Internal	INTATRAP (Address Trap interrupt)	Non-maskable	IL ₂	FFFA _H	2
Internal	INTWDT (Watchdog Timer interrupt)	Non-maskable	IL ₃	FFF8 _H	2
External	INT0 (External interrupt 0)	IMF·EF ₄ = 1	IL ₄	FFF6 _H	5
External	INT1 (External interrupt 1)	IMF·EF ₅ = 1	IL ₅	FFF4 _H	6
Internal	INTTBT (Time Base Timer interrupt)	IMF·EF ₆ = 1	IL ₆	FFF2 _H	7
External	INT2 (External interrupt2)	IMF·EF ₇ = 1	IL ₇	FFF0 _H	8
Internal	INTTC1 (18-bit TC1 interrupt)	IMF·EF ₈ = 1	IL ₈	FFEE _H	9
Internal	INTRxD (UART received interrupt)	IMF·EF ₉ = 1	IL ₉	FFEC _H	10
Internal	INTSIO (SIO interrupt)				
Internal	INTTxD (UART transmitted interrupt)	IMF·EF ₁₀ = 1	IL ₁₀	FFEA _H	11
Internal	INTTC4 (TC4 interrupt)	IMF·EF ₁₁ = 1	IL ₁₁	FFE8 _H	12
Internal	INTTC6 (TC6 interrupt)	IMF·EF ₁₂ = 1	IL ₁₂	FFE6 _H	13
Internal	INTADC (AD converter interrupt)	IMF·EF ₁₃ = 1	IL ₁₃	FFE4 _H	14
External	INT3 (External interrupt 3)	IMF·EF ₁₄ = 1	IL ₁₄	FFE2 _H	15
Internal	INTTC3 (TC3 interrupt)				
External	INT5 (External interrupt 5)	IMF·EF ₁₅ = 1	IL ₁₅	FFE0 _H	Low 16
Internal	INTTC5 (TC5 interrupt)				

Note 1: The following interrupt factors share their interrupt source; the factor is selected on the register INTSEL.

1. INTRxD and INTSIO share the source whose priority is 10.
2. INT3 and INTTC3 share the source whose priority is 15.
3. INT5 and INTTC5 share the source whose priority is 16.

Note 2: To use the address trap interrupt (INTATRAP), clear WDTCR1<ATOUT> to “0” (It is set for the “Reset request” after reset is released). For details, see 2.4.5 Address Trap.

Note 3: To use the watchdog timer interrupt (INTWDT), clear WDTCR1<WDTOUT> to “0” (It is set for the “Reset request” after reset is released). For details, see 2.4 Watchdog Timer.

(1) Interrupt latches (IL₁₅ to IL₂)

An interrupt latch is provided for each interrupt source, except for a software interrupt. When interrupt request is generated, the latch is set to “1”, and the CPU is requested to accept the interrupt if its interrupt is enabled. All interrupt latches are initialized to “0” during reset.

The interrupt latches are located on address 003CH and 003DH in SFR area. Except for IL₃ and IL₂, each latch can be cleared to “0” individually by instruction. (However, the read-modify-write instructions such as bit manipulation or operation instructions cannot be used. Interrupt request would be cleared inadequately if interrupt is requested while such instructions are executed.) Thus interrupt request can be canceled/initialized by software.

Interrupt latches are not set to “1” by an instruction. Since interrupt latches can be read, the status for interrupt requests can be monitored by software.

Note: When manipulating IL, clear IMF (to disable interrupts) beforehand.

Example 1: Clears interrupt latches

```
DI                ; IMF ← 0
LDW      (ILL), 1110100000111111B ; IL12, IL10 to IL6 ← 0
EI                ; IMF ← 1
```

Example 2: Reads interrupt latches

```
LD      WA, (ILL) ; W ← ILH, A ← ILL
```

Example 3: Tests an interrupt latches

```
TEST      (IL).7 ; IL7 = 1 then jump
JR      F, SSET
```

(2) Interrupt enable register (EIR)

The interrupt enable register (EIR) enables and disables the acceptance of interrupts, except for the non-maskable interrupts (Software interrupt, undefined instruction interrupt, address trap interrupt and watchdog interrupt). Non-maskable interrupt is accepted regardless of the contents of the EIR.

The EIR consists of an interrupt master enable flag (IMF) and the individual interrupt enable flags (EF). These registers are located on address 003AH and 003BH in SFR area, and they can be read and written by an instructions (Including read-modify-write instructions such as bit manipulation or operation instructions).

a. Interrupt master enable flag (IMF)

The interrupt enable register (IMF) enables and disables the acceptance of the whole maskable-interrupt. While IMF = “0”, all maskable interrupts are not accepted regardless of the status on each individual interrupt enable flag (EF). By setting IMF to “1”, the interrupt becomes acceptable if the individuals are enabled. When an interrupt is accepted, IMF is cleared to “0” after the latest status on IMF is stacked. Thus the maskable interrupts which follow are disabled. By executing return interrupt instruction [RETI/RETN], the stacked data, which was the status before interrupt acceptance, is loaded on IMF again.

The IMF is located on bit0 in EIRL (Address: 003AH in SFR), and can be read and written by an instruction. The IMF is normally set and cleared by [EI] and [DI] instruction respectively. During reset, the IMF is initialized to “0”, and maskable interrupts are not accepted until it is set to “1”.

b. Individual interrupt enable flags (EF₁₅ to EF₄)

Each of these flags enables and disables the acceptance of its maskable interrupt. Setting the corresponding bit of an individual interrupt enable flag to “1” enables acceptance of its interrupt, and setting the bit to “0” disables acceptance. The individual interrupt enable flags (EF₂₃ to EF₄) are located on EIRE, EIRL to EIRH (address: 002CH, 003AH to 003BH in SFR), and can be read and written by an instruction. During reset, all the individual interrupt enable flags (EF₂₃ to EF₄) are initialized to “0” and all maskable interrupts are not accepted until they are set to “1”.

Note: Before manipulating EF, be sure to clear IMF (Interrupt disabled). Then set IMF newly again after operating on the interrupt enables flag (EF). Normally, IMF is clear to “0” automatically on service routine. When IMF is set to “1” for using a multiple interrupt on service routine, be sure to process as is the case with EF.

Example 1: Enables interrupts individually and sets IMF

```
DI          ; IMF ← 0
LDW        (EIRL),      ; EF14, EF13, EF11, EF7, EF5 ← “1”
    ...      0110100010100000B      Note: IMF is not set.
EI          ; IMF ← “1”
```

Example 2: C compiler description example

```
unsigned int _io (3AH) EIRL;      ; /* 3AH shows EIRL address */
_DI ();
EIRL = 10100000B;
...
_EI ();
```

Figure 1.5.2 Interrupt Latch (IL), Interrupt Enable Registers (EIR)

(3) Selecting interrupt factor (INTSEL)

Each interrupt factor, that shares its interrupt source with other factors, enables its interrupt latch (IL) only if it is selected on INTSEL. The interrupt controller does not hold the interrupt request, while the factor generates the interrupt request is not selected on INTSEL. Therefore, set INTSEL appropriately before interrupt factors arises.

Figure 1.5.3 Interrupt source selector

1.5.1 Interrupt Sequence

An interrupt request, which raised interrupt latch, is held, until interrupt is accepted or interrupt latch is cleared to "0" by resetting or an instruction. Interrupt acceptance sequence requires 8-machine cycles (4 μ s at 8.0 MHz) after the completion of the current instruction. The interrupt service task terminates upon execution of an interrupt return instruction [RETI] (for maskable interrupts) or [RETN] (for non-maskable interrupts). Figure 1.5.4 shows the timing chart of interrupt acceptance processing.

(1) Interrupt acceptance processing is packaged as follows.

1. The interrupt master enable flag (IMF) is cleared to "0" in order to disable the acceptance of any following interrupt.
2. The interrupt latch (IL) for the interrupt source accepted is cleared to "0".
3. The contents of the program counter (PC) and the program status word, including the interrupt master enable flag (IMF), are saved (Pushed) on the stack in sequence of PSW + IMF, PCH, PCL. Meanwhile, the stack pointer (SP) is decremented by 3.
4. The entry address (Interrupt vector) of the corresponding interrupt service program, loaded on the vector table, is transferred to the program counter.
5. The instruction stored at the entry address of the interrupt service program is executed.

Note: When the contents of PSW are saved on the stack, the contents of IMF are also saved.

Figure 1.5.4 Timing Chart of Interrupt Acceptance/Return Interrupt Instruction

Example: Correspondence between vector table address for INTTBT and the entry address of the interrupt service program

A maskable interrupt is not accepted until the IMF is set to "1" even if the maskable interrupt higher than the level of current servicing interrupt is requested.

In order to utilize nested interrupt service, the IMF is set to "1" in the interrupt service program. In this case, acceptable interrupt sources are selectively enabled by the individual interrupt enable flags.

To avoid overloaded nesting, clear the individual interrupt enable flag whose interrupt is currently serviced, before setting IMF to "1". As for non-maskable interrupt, keep interrupt service shorter compared with length between interrupt requests; otherwise the status cannot be recovered as non-maskable interrupt would simply nested.

(2) Saving/restoring general-purpose registers

During interrupt acceptance processing, the program counter (PC) and the program status word (PSW, includes IMF) are automatically saved on the stack, but the accumulator and others are not. These registers are saved by software if necessary. When multiple interrupt services are nested, it is also necessary to avoid using the same data memory area for saving registers. The following methods are used to save/restore the general-purpose registers.

a. Using PUSH and POP instructions

To save only a specific register, PUSH and POP instructions are available.

Example: Save/store register using PUSH and POP instructions

```

PINTxx:  PUSH    WA           ; Save WA register
          (interrupt processing)
          POP     WA           ; Restore WA register
          RETI                ; RETURN
  
```

b. Using data transfer instructions

To save only a specific register without nested interrupts, data transfer instructions are available.

Example: Save/store register using data transfer instructions

```

PINTxx:  LD      (GSAVA), A          ; Save A register
          (interrupt processing)
          LD      A, (GSAVA)         ; Restore A register
          RETI                       ; RETURN
  
```

Figure 1.5.5 Saving/Restoring General-purpose Registers under Interrupt Processing

(3) Interrupt return

Interrupt return instructions [RETI]/[RETN] perform as follows.

[RETI]/[RETN] Interrupt Return	
1.	Program Counter (PC) and program status word (PSW, includes IMF) are restored from the stack.
2.	Stack pointer (SP) is incremented by 3.

As for Address Trap interrupt (INTARTAP), it is required to alter stacked data for program counter (PC) to restarting address, during interrupt service program. Otherwise returning interrupt causes INTATRAP again. When interrupt acceptance processing has completed, stacked data for PCL and PCH are located on address (SP + 1) and (SP + 2) respectively.

Note: If [RETN] is executed with the above data unaltered, the program returns to the address trap area and INTATRAP occurs again.

Example 1: Returning from address trap interrupt (INTATRAP) service program

```

PINTxx:  POP      WA          ; Recover SP by 2
          LD       WA, Return Address ;
          PUSH     WA          ; Alter stacked data
          (interrupt processing)
          RETN                ; RETURN

```

Example 2: Restarting without returning interrupt (In this case, PSW (includes IMF) before interrupt acceptance is discarded.)

```

PINTxx  INC      SP          ; Recover SP by 3
          INC      SP          ;
          INC      SP          ;
          (interrupt processing)
          LD       EIRL, data  ; Set IMF to "1" or clear it to "0"
          JP       Restart Address ; Jump into restarting address

```

Note: It is recommended that stack pointer be return to rate before INTATRAP (increment 3 times), if return interrupt instruction [RETN] is not utilized during interrupt service program under INTATRAP (such as Example 2).

Interrupt requests are sampled during the final cycle of the instruction being executed. Thus, the next interrupt can be accepted immediately after the interrupt return instruction is executed.

Note: When the interrupt processing time is longer than the interrupt request generation time, the interrupt service task is performed but not the main task.

1.5.2 Software Interrupt (INTSW)

Executing the [SWI] instruction generates a software interrupt and immediately starts interrupt processing (INTSW is highest prioritized interrupt).

Use the [SWI] instruction only for detection of the address error or for debugging.

(1) Address error detection

FFH is read if for some cause such as noise the CPU attempts to fetch an instruction from a non-existent memory address during single chip mode. Code FFH is the SWI instruction, so a software interrupt is generated and an address error is detected. The address error detection range can be further expanded by writing FFH to unused areas of the program memory. Address trap reset is generated in case that an instruction is fetched from RAM or SFR areas.

(2) Debugging

Debugging efficiency can be increased by placing the SWI instruction at the software break point setting address.

1.5.3 Undefined Instruction Interrupt (INTUNDEF)

Taking code which is not defined as authorized instruction for instruction causes INTUNDEF. INTUNDEF is generated when the CPU fetches such a code and tries to execute it. INTUNDEF is accepted even if non-maskable interrupt is in process. Contemporary process is broken and INTUNDEF interrupt process starts, soon after it is requested.

Note: The undefined instruction interrupt (INTUNDEF) forces CPU to jump into vector address, as software interrupt (SWI) does.

1.5.4 Address Trap Interrupt (INTATRAP)

Fetching instruction from unauthorized area for instructions (Address trapped area) causes reset-output or address trap interrupt (INTATRAP). INTATRAP is accepted even if non-maskable interrupt is in process. Contemporary process is broken and INTATRAP interrupt process starts, soon after it is requested.

Note: The operating mode under address trapped, whether to be reset-output or interrupt processing, is selected on watchdog timer control register (WDTCR).

1.5.5 External Interrupts

The TMP86FM29 has five external interrupt inputs. These inputs are equipped with digital noise reject circuits (Pulse inputs of less than a certain time are eliminated as noise).

Edge selection is also possible with INT1 to INT3. $\overline{\text{INT0}}$ /P63 pin can be configured as either an external interrupt input pin or an input/output port, and is configured as an input port during reset.

Edge selection, noise reject control and $\overline{\text{INT0}}$ /P63 pin function selection are performed by the external interrupt control register (EINTCR).

1.6 Reset Circuit

The TMP86FM29 has four types of reset generation procedures: an external reset input, an address trap reset output, a watchdog timer reset output and a system clock reset output. Table 1.6.1 shows on-chip hardware initialization by reset action.

Since the reset circuit has an 11-stage counter for generation of flash reset, which is the reset counter for stabilizing of the power supply for Flash, the reset period is $2^{10}/f_c$ [s] (64 μ s at 16.0 MHz).

Because the malfunction reset output circuit such as watchdog timer reset, address trap reset and system clock reset is not initialized when power is turned on, the $\overline{\text{RESET}}$ pin outputs “L” level for the maximum $24/f_c$ [s] (1.5 μ s at 16.0 MHz).

Therefore, the maximum reset period is $24/f_c$ [s] + $2^{10}/f_c$ [s] (65.5 μ s at 16.0 MHz).

Table 1.6.1 shows on-chip hardware initialization by reset action.

Table 1.6.1 Initializing Internal Status by Reset Action

On-chip Hardware	Initial Value	On-chip Hardware	Initial Value
Program counter (PC)	(FFFE _H)	Prescaler and Divider of timing generator	0
Stack pointer (SP)	Not initialized		
General-purpose registers (W, A, B, C, D, E, H, L, IX, IY)	Not initialized		
Jump status flag (JF)	Not initialized	Watchdog timer	Enable
Zero flag (ZF)	Not initialized	Output latches of I/O ports	Refer to I/O port circuitry
Carry flag (CF)	Not initialized		
Half carry flag (HF)	Not initialized		
Sign flag (SF)	Not initialized		
Overflow flag (VF)	Not initialized		
Interrupt master enable flag (IMF)	0	Control registers	Refer to each of control register
Interrupt individual enable flags (EF)	0		
Interrupt latches (IL)	0	RAM	Not initialized

1.6.1 External Reset Input

The $\overline{\text{RESET}}$ pin contains a Schmitt trigger (Hysteresis) with an internal pull-up resistor.

When the $\overline{\text{RESET}}$ pin is held at “L” level for at least 3 machine cycles ($12/f_c$ [s]) with the power supply voltage within the operating voltage range and oscillation stable, a reset is applied and the internal state is initialized.

When $2^{10}/f_c$ (65.5 μ s at 16 MHz) period passes after the $\overline{\text{RESET}}$ pin input goes high, the reset operation is released and the program execution starts at the vector address stored at addresses FFFE_H to FFFF_H.

Figure 1.6.1 Reset Circuit

1.6.2 Address-Trap-Reset

If the CPU should start looping for some cause such as noise and an attempt be made to fetch an instruction from the on-chip RAM (when WDTTCR1<ATAS> is set to “1”) or the SFR area, address-trap-reset and the Flash reset will be generated. During address-trap-reset, the RESET pin outputs “L” level. The reset time is maximum $24/f_c$ [s] + $2^{10}/f_c$ [s] (65.5 μs at 16.0 MHz).

Figure 1.6.2 Address-Trap-Reset

Note: The operating mode under address trapped is alternative of reset or interrupt. Address trap or no address trap can be selected by WDTTCR1<ATAS> for the internal RAM.

1.6.3 Watchdog Timer Reset

Refer to Section “2.4 Watchdog Timer”.

1.6.4 System-Clock-Reset

If the condition as follows is detected, the system clock reset occurs automatically to prevent dead lock of the CPU. (The oscillation is continued without stopping.)

During system clock reset, the RESET pin outputs “L” level.

- In case of clearing SYSCR2<XEN> and SYSCR2<XTEN> simultaneously to “0”.
- In case of clearing SYSCR2<XEN> to “0”, when the SYSCR2<SYSCK> is “0”.
- In case of clearing SYSCR2<XTEN> to “0”, when the SYSCR2<SYSCK> is “1”.

When the system clock reset is generated, the flash reset is also generated. Therefore, the maximum reset period is $24/f_c$ [s] + $2^{10}/f_c$ [s] (65.5 μs at 16.0 MHz).

2. On-Chip Peripherals Functions

2.1 Special Function Register (SFR)

The TMP86FM29 adopt the memory mapped I/O system, and all peripheral control and data transfers are performed through the special function register (SFR). The SFR is mapped on address 0000H to 003FH, DBR is mapped on address 0F80H to 0FFFH.

Figure 2.1.1 to Figure 2.1.2 indicate the special function register (SFR) and data buffer register (DBR) for TMP86FM29.

Address	Read	Write	Address	Read	Write
0000H	Reserved		0020H	ADCDR1 (AD converter register 1)	-
01	P1DR (P1 Port output latch)		21	ADCDR2 (AD converter register 2)	-
02	P2DR (P2 Port output latch)		22	Reserved	
03	P3DR (P3 Port output latch)		23	Reserved	
04	P3OUTCR (P3 Port output circuit control)		24	Reserved	
05	P5DR (P5 Port output latch)		25	UARTSR (UART Status register)	UARTCR1 (UART control register 1)
06	P6DR (P6 Port output latch)		26	-	UARTCR2 (UART control register 2)
07	P7DR (P7 Port output latch)		27	Reserved	
08	P1PRD (P1 Terminal input)	-	28	LCDCCR (LCD Control register)	
09	P2PRD (P2 Terminal input)	-	29	P1LCR (P1 segment output control)	
0A	P3PRD (P3 Terminal input)	-	2A	P5LCR (P5 segment output control)	
0B	P5PRD (P5 Terminal input)	-	2B	P7LCR (P7 segment output control)	
0C	P6CR (P6 Port input/output control)	-	2C	PWREG3 (Timer register 3)

Note 1: Do not access reserved areas by the program.

Note 2: –; Cannot be accessed.

Note 3: Write-only registers and interrupt latches cannot use the read-modify-write instructions (bit manipulation instructions such as SET, CLR, etc. and logical operation instructions such as AND, OR, etc.).

Figure 2.1.2 The special function register (SFR) for TMP86FM29 (2/2)

2.2 I/O Ports

The TMP86FM29 have 6 parallel input/output ports (39 pins) as follows.

	Primary Function	Secondary Functions
Port P1	8-bit I/O port	External interrupt input, serial interface input/output, UART input/output, segment output and serial PROM mode control input.
Port P2	3-bit I/O port	Low-frequency resonator connections, external interrupt input, STOP mode release signal input.
Port P3	4-bit I/O port	Timer/counter input/output and divider output.
Port P5	8-bit I/O port	Segment output.
Port P6	8-bit I/O port	Analog input, external interrupt input, timer/counter input and STOP mode release signal input.
Port P7	8-bit I/O port	Segment output.

Each output port contains a latch, which holds the output data. All input ports do not have latches, so the external input data should be externally held until the input data is read from outside or reading should be performed several times before processing. Figure 2.2.1 shows input/output timing examples.

External data is read from an I/O port in the S1 state of the read cycle during execution of the read instruction. This timing cannot be recognized from outside, so that transient input such as chattering must be processed by the program.

Output data changes in the S2 state of the write cycle during execution of the instruction which writes to an I/O port.

Figure 2.2.1 Input/Output timing (example)

2.2.1 Port P1 (P17 to P10)

Port P1 is an 8-bit input/output port which is also used as an external interrupt input, serial interface input/output, UART input/output, segment output of LCD and serial PROM mode control input. When used as a segment pins of LCD, the respective bit of P1LCR should be set to “1”.

When used as an input port or a secondary function (except for segment) pins, the respective output latch (P1DR) should be set to “1” and its corresponding P1LCR bit should be set to “0”. When used as an output port, the respective P1LCR bit should be set to “0”. During reset, the output latch is initialized to “1”.

For detail of the serial PROM mode, refer to “2.16 Serial PROM mode”.

P1 port output latch (P1DR) and P1 port terminal input (P1PRD) are located on their respective address.

When read the output latch data, the P1DR should be read and when read the terminal input data, the P1PRD register should be read.

If the terminal input data which is configured as LCD segment output is read, unstable data is read.

Figure 2.2.2 Port 1

2.2.2 Port P2 (P22 to P20)

Port P2 is a 3-bit input/output port.

It is also used as an external interrupt, a STOP mode release signal input, and low-frequency crystal oscillator connection pins. When used as an input port or a secondary function pins, respective output latch (P2DR) should be set to "1".

During reset, the P2DR is initialized to "1".

A low-frequency crystal oscillator (32.768 kHz) is connected to pins P21 (XTIN) and P22 (XTOUT) in the dual-clock mode. In the single-clock mode, pins P21 and P22 can be used as normal input/output ports.

It is recommended that pin P20 should be used as an external interrupt input, a STOP mode release signal input, or an input port. If it is used as an output port, the interrupt latch is set on the falling edge of the output pulse.

P2 port output latch (P2DR) and P2 port terminal input (P2PRD) are located on their respective address.

When read the output latch data, the P2DR should be read and when read the terminal input data, the P2PRD register should be read. If a read instruction is executed for port P2, read data of bits 7 to 3 are unstable.

Figure 2.2.3 Port 2

Note: Port P20 is used as $\overline{\text{STOP}}$ pin. Therefore, when stop mode is started, OUTEN does not affect to P20, and P20 becomes High-Z mode.

2.2.3 Port P3 (P33 to P30)

Port P3 is a 4-bit input/output port.

It is also used as a timer/counter input/output, divider output.

When used as a timer/counter output or divider output, respective output latch (P3DR) should be set to "1".

It can be selected whether output circuit of P3 port is C-MOS output or a sink open drain individually, by setting P3OUTCR. When a corresponding bit of P3OUTCR is "0", the output circuit is selected to a sink open drain and when a corresponding bit of P3OUTCR is "1", the output circuit is selected to a C-MOS output. When used as an input port or timer/counter input, respective output control (P3OUTCR) should be set to "0" after P3DR is set to "1". During reset, the P3DR is initialized to "1", and the P3OUTCR is initialized to "0".

P3 port output latch (P3DR) and P3 port terminal input (P3PRD) are located on their respective address.

When read the output latch data, the P3DR should be read and when read the terminal input data, the P3PRD register should be read. If a read instruction is executed for port P3, read data of bits 7 to 4 are unstable.

Figure 2.2.4 Port 3

2.2.4 Port P5 (P57 to P50)

Port P5 is an 8-bit input/output port which is also used as a segment pins of LCD.

When used as input port, the respective output latch (P5DR) should be set to "1".

During reset, the P5DR is initialized to "1".

When used as a segment pins of LCD, the respective bit of P5LCR should be set to "1".

When used as an output port, the respective P5LCR bit should be set to "0".

P5 port output latch (P5DR) and P5 port terminal input (P5PRD) are located on their respective address.

When read the output latch data, the P5DR should be read and when read the terminal input data, the P5PRD register should be read. If the terminal input data which is configured as LCD segment output is read, unstable data is read.

Figure 2.2.5 Port 5

2.2.5 Port P6 (P67 to P60)

Port P6 is an 8-bit input/output port which can be configured as an input or an output in one-bit unit. Port P6 is also used as an analog input, Key on Wake up input, timer/counter input and external interrupt input. Input/output mode is specified by the P6 control register (P6CR), the P6 output latch (P6DR), and AINDS (bit 4 in ADCCR1). During reset, P6CR and P6DR are initialized to "0" and AINDS is set to "1". At the same time, the input data of pins P67 to P60 are fixed to "0". To use port P6 as an input port, external interrupt input, timer/counter input or key on wake up input, set data of P6DR to "1" and P6CR to "0". To use it as an output port, set data of P6CR to "1". To use it as an analog input, set data of P6DR to "0" and P6CR to "0", and start the AD. It is the penetration electric current measures by the analog voltage.

Pins not used for analog input can be used as I/O ports. During AD conversion, output instructions should not be executed to keep a precision. In addition, a variable signal should not be input to a port adjacent to the analog input during AD conversion.

When the AD converter is in use (P6DR = 0), bits mentioned above are read as "0" by executing input instructions.

Figure 2.2.6 Port 6 and P6CR

Note: Although P6DR is a read/writer register, because it is also used as an input mode control function, read-modify-write instructions such as bit manipulate instructions cannot be used.

Read-modify-write instruction writes the all data of 8-bit after data is read and modified. Because a bit setting Input mode read data of terminal, the output latch is changed by these instruction. So P6 port can not input data.

2.2.6 Port P7 (P77 to P70)

Port P7 is an 8-bit input/output port which is also used as a segment pins of LCD.

When used as input port, the respective output latch (P7DR) should be set to “1”.

During reset, the P7DR is initialized to “1”.

When used as a segment pins of LCD, the respective bit of P7LCR should be set to “1”.

When used as an output port, the respective P7LCR bit should be set to “0”.

P7 port output latch (P7DR) and P7 port terminal input (P7PRD) are located on their respective address.

When read the output latch data, the P7DR should be read and when read the terminal input data, the P7PRD register should be read. If the terminal input data which is configured as LCD segment output is read, unstable data is read.

Figure 2.2.7 Port 7

2.3 Time Base Timer (TBT)

The time base timer generates time base for key scanning, dynamic displaying, etc. It also provides a time base timer interrupt (INTTBT).

An INTTBT is generated on the first falling edge of source clock (The divider output of the timing generator) after the time base timer has been enabled. The divider is not cleared by the program; therefore, only the first interrupt may be generated ahead of the set interrupt period (Figure 2.3.1 (b)).

The interrupt frequency (TBTCK) must be selected with the time base timer disabled (the interrupt frequency must not be changed with the disable from the enable state). Both frequency selection and enabling can be performed simultaneously.

Figure 2.3.1 Time Base Timer

Example: Sets the time base timer frequency to $fc/2^{16}$ [Hz] and enables an INTTBT interrupt.

```
LD      (TBTCCR), 00000010B    ; TBTCK ← 010
LD      (TBTCCR), 00001010B    ; TBTEN ← 1
DI                                     ; IMF ← 0
SET     (EIRL). 6
```

2.4 Watchdog Timer (WDT)

The watchdog timer is a fail-safe system to rapidly detect the CPU malfunctions such as endless looping caused by noise or the like, or deadlock and resume the CPU to the normal state.

The watchdog timer signal for detecting malfunction can be selected either a “reset request” or a non-maskable “interrupt request”. However, selection is possible only once after reset. At first the “reset request” is selected.

When the watchdog timer is not being used for malfunction detection, it can be used as a timer to generate an interrupt at fixed intervals.

Note: Care must be given in system design so as to protect the watchdog timer from disturbing noise. Otherwise the Watchdog Timer may not fully exhibit its functionality.

2.4.1 Watchdog Timer Configuration

Figure 2.4.1 Watchdog Timer Configuration

2.4.2 Watchdog Timer Control

Figure 2.4.2 shows the watchdog timer control registers (WDTCR1, WDTCR2). The watchdog timer is automatically enabled after reset.

(1) Malfunction detection methods using the watchdog timer

The CPU malfunction is detected as follows.

1. Setting the detection time, selecting output, and clearing the binary counter.
2. Repeatedly clearing the binary counter within the setting detection time

If the CPU malfunctions such as endless looping or deadlock occur for any cause, the watchdog timer output will become active at the rising of an overflow from the binary counters unless the binary counters are cleared. At this time, when $WDTCR1<WDTOUT> = "1"$, the $\overline{RESET}$ pin outputs "L" level and then the internal hardware is reseted. When $WDTCR1<WDTOUT> = "0"$, a watchdog timer interrupt (INTWDT) is generated.

The watchdog timer temporarily stops counting in STOP mode including warm-up or IDLE mode, and automatically restarts (Continues counting) when the STOP/IDLE mode is released.

Note: The watchdog timer consists of an internal divider and a two-stage binary counter. When clear code $4E_H$ is written, only the binary counter is cleared, not the internal divider. Depending on the timing at which clear code $4E_H$ is written on the WDTCR2 register, the overflow time of the binary counter may be at minimum 3/4 of the time set in WDTCR1 <WDTT>. Thus, write the clear code using a shorter cycle than 3/4 of the time set in WDTCR1 <WDTT>.

Example: Sets the watchdog timer detection time to $2^{21}/f_c$ [s] and resets the CPU malfunction.

SYSCR1	LD	(WDTCR2), $4E_H$	; Clears the binary counters
	LD	(WDTCR1), 00001101_B	; $WDTT \leftarrow 10, WDTOUT \leftarrow 1$
	LD	(WDTCR2), $4E_H$	; Clears the binary counters (Always clear immediately before and after changing WDTT)
Within 3/4 of WDT detection time	LD	(WDTCR2), $4E_H$	; Clears the binary counters
Within 3/4 of WDT detection time	LD	(WDTCR2), $4E_H$	; Clears the binary counters

Figure 2.4.2 Watchdog Timer Control Registers

(2) Watchdog timer enable

The watchdog timer is enabled by setting WDTCR1<WDTEN> to "1".

WDTCR1<WDTEN> is initialized to "1" during reset, so the watchdog timer operates immediately after reset is released.

(3) Watchdog timer disable

To disable the watchdog time, write "4E_H" (Clear code) to WDTCR2 for clearing the binary counter before writing "0" to WDTCR1<WDTEN>, and then write "B1_H" (Disable code) to WDTCR2. The watchdog timer is not disabled if this procedure is reversed and the disable code is written to WDTCR2 before WDTCR1<WDTEN> is cleared to "0". Also, immediately before these procedure, disable the interrupt master flag (IMF) by DI instruction. During disabling the watchdog timer, the binary counters are cleared to "0".

Example: Disables watchdog timer

```

DI          ; IMF ← 0
LD          (WDTCR2), 4EH      ; Clear the binary counter
LDW        (WDTCR1), 0B101H    ; WDTEN ← 0, WDTCR2 ← Disable code
  
```

Table 2.4.1 Watchdog Timer Detection Time (Example: $f_c = 16 \text{ MHz}$, $f_s = 32.768 \text{ kHz}$)

WDTT	Watchdog Timer Detection Time [s]		
	NORMAL1/2 Mode		SLOW Mode
	DV7CK = 0	DV7CK = 1	
00	2.097	4	4
01	524.288 m	1	1
10	131.072 m	250 m	250 m
11	32.768 m	62.5 m	62.5 m

2.4.3 Watchdog Timer Interrupt (INTWDT)

This is a non-maskable interrupt which can be accepted regardless of the contents of the EIR. If a watchdog timer interrupt or a software interrupt is already accepted, however, the new watchdog timer interrupt waits until the previous interrupt processing is completed (The end of the [RETN] instruction execution).

The stack pointer (SP) should be initialized before using the watchdog timer output as an interrupt source with WDTOUT.

Example: Watchdog timer interrupt setting up

```

LD          SP, 023FH          ; Sets the stack pointer
LD          (WDTCR1), 00001000B ; WDTOUT ← 0
  
```

2.4.4 Watchdog Timer Reset

If the watchdog timer reset request occur, the RESET pin outputs "L" level and then the internal hardware is reset. When the watchdog timer reset is generated, the flash reset is also generated. Therefore, the maximum reset period is $24/f_c [s] + 2^{10}/f_c [s]$ (65.5 μs at 16.0 MHz).

Note: The high-frequency clock oscillator also immediately turns on when a watchdog timer reset is generated in SLOW mode. In this case, the reset time may include a certain amount of error if there is any fluctuation of the oscillation frequency at starting the high-frequency clock oscillation. Therefore, the reset time must be considered an approximated value.

Figure 2.4.3 Watchdog Timer Interrupt/Reset

2.5 Address Trap

The watchdog timer control register 1, 2 shares its addresses with the control registers in case of address trap. These control registers for address trap are shown on Figure 2.5.1.

Figure 2.5.1 Watchdog Timer Control Registers

(1) Selection of address trap in internal RAM (ATAS)

Using WDTCR1<ATAS>, address trap or no address trap can be selected for the internal RAM area. To execute an instruction in the internal RAM area, set "0" in WDTCR1<ATAS>. Setting in WDTCR1<ATAS> becomes valid after control code D2_H is written in WDTCR2. Executing an instruction in the SFR/DBR area generates an address trap unconditionally regardless of the setting in WDTCR1<ATAS>.

(2) Selection of operation at address trap (ATOUT)

As the operation at address trap either interrupt generation or reset generation ($\overline{\text{RESET}}$ pin outputs "L" level) can be selected by WDTCR1<ATOUT>.

2.6 Divider Output (DVO)

Approximately 50% duty pulse can be output using the divider output circuit, which is useful for piezoelectric buzzer drive. Divider output is from pin P30 ($\overline{\text{DVO}}$). The P51 output latch should be set to "1".

Note: Selection of divider output frequency must be made while divider output is disabled.

Also, in other words, when changing the state of the divider output frequency from enabled to disable, do not change the setting of the divider output frequency.

TBTCR (0036 _H)	7	6	5	4	3	2	1	0	
	DVOEN	DVQCK	(DV7CK)	(TBTEN)		(TBTCK)			(Initial value: 0000 0000)

2.7 18-Bit Timer/Counter (TC1)

2.7.1 Configuration

Figure 2.7.1 Timer/Counter 1

2.7.2 Control

The Timer/counter 1 is controlled by timer/counter 1 control registers (TC1CR1/TC1CR2), an 18-bit timer register (TREG1A), and an 8-bit internal window gate pulse setting register (TREG1B).

Timer register																		
17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
TREG1A _H (0012 _H)		TREG1A _M (0011 _H)								TREG1A _L (0010 _H)								
TREG1A (0012 _H , 0011 _H , 0010 _H)																		
Read/Write (Initial value: 00 0000 0000 0000 0000)																		
Internal window gate pulse setting register																		
TREG1B (0013 _H)		7	6	5	4	3	2	1	0									
		Ta				Tb				(Initial value: 0000 0000)								
Ta		Setting "H" level period of the window gate pulse								(16 – Ta) × 2 ¹³ /fc or (16 – Ta) × 2 ⁵ /fs [s]								R/W
Tb		Setting "L" level period of the window gate pulse								(16 – Tb) × 2 ¹³ /fc or (16 – Tb) × 2 ⁵ /fs [s]								
Note 1: WGPSCK = 01																		
Timer/counter 1 control register 1																		
TR1CR1 (0014 _H)		7	6	5	4	3	2	1	0									
		TC1C		TC1S		TC1CK		TC1M		(Initial value: 1000 1000)								
TC1C										0: Counter/overflow flag clear request ("1" is automatically set after clearing.)								R/W
TC1S		TC1 start control								00: Stop and counter clear and overflow flag clear 10: Start *1: Reserved								
TC1CK		TC1 source clock select								000: Internal clock fc [Hz] 001: Internal clock fs [Hz] 010: Internal clock fc/2 ²³ or fs/2 ¹⁵ [Hz] 011: Internal clock fc/2 ¹³ or fs/2 ⁵ [Hz] 100: Internal clock fc/2 ¹¹ or fs/2 ³ [Hz] 101: Internal clock fc/2 ⁷ [Hz] 110: Internal clock fc/2 ³ [Hz] 111: External clock (ECIN pin input)								
TC1M		TC1 mode select								00: Timer/Event counter mode 01: Reserved 10: Pulse width measurement mode 11: Frequency measurement mode								

Note 1: fc: High-frequency clock [Hz] fs; Low-frequency clock [Hz] *: Don't care

Note 2: Writing to the low-byte of the timer register 1A (TREG1A_L, TREG1A_M), the compare function is inhibited until the high-byte (TREG1A_H) is written.

Note 3: Set the mode and source clock, and edge (selection) when the TC1 stops (TC1S = 00).

Note 4: "fc" can be selected as the source clock only in the timer mode during SLOW mode and in the pulse width measurement mode during NORMAL 1/2 or IDLE 1/2 mode.

Note 5: When a read instruction is executed to the timer register (TREG1A), the counter immediate value, not the register set value, is read out. Therefore it is impossible to read out the written value of TREG1A. To read the counter value, the read instruction should be executed when the counter stops to avoid reading unstable value.

Note 6: Set the timer register (TREG1A) to ≥ 1.

Note 7: When using the timer mode and pulse width measurement mode, set TC1CK (TC1 source clock select) to internal clock.

Note 8: When using the event counter mode, set TC1CK (TC1 source clock select) to external clock.

Note 9: Because the read value is different from the written value, do not use read-modify-write instructions to TREG1A.

Note 10: fc/2⁷ and fc/2³ can not be used as source clock in SLOW/SLEEP mode.

Note 11: The read data of bits 7 to 2 in TREG1A_H are always "0". (Data "1" can not be written.)

Figure 2.7.2 Timer register/window gate pulse setting register/control register of the TC1

2.7.3 Function

TC1 has four operating modes. The timer mode of the TC1 is used at warm-up when switching from SLOW mode to NORMAL2 mode.

(1) Timer mode

In this mode, counting up is performed using the internal clock. The contents of TREG1A are compared with the contents of up-counter. If a match is found, an INTTC1 interrupt is generated, and the counter is cleared. Counting up resumes after the counter is cleared.

Table 2.7.1 Source clock (internal clock) of Timer/Counter 1

Source Clock				Resolution		Maximum Time Setting	
NORMAL1/2, IDLE1/2 Mode		SLOW Mode	SLEEP Mode	fc = 16 MHz	fs = 32.768 kHz	fc = 16 MHz	fs = 32.768 kHz
DV7CK = 0	DV7CK = 0						
fc/2 ²³ [Hz]	fs/2 ¹⁵ [Hz]	fc/2 ¹⁵ [Hz]	fc/2 ¹⁵ [Hz]	0.52 [s]	1 [s]	38.2 [h]	72.8 [h]
fc/2 ¹³	fs/2 ⁵	fc/2 ⁵	fc/2 ⁵	512 [μs]	0.98 [ms]	2.2 [min]	4.3 [min]
fc/2 ¹¹	fs/2 ³	fc/2 ³	fc/2 ³	128 [μs]	244 [μs]	0.6 [min]	1.07 [min]
fc/2 ⁷	fc/2 ⁷	—	—	8 [μs]	—	2.1 [s]	—
fc/2 ³	fc/2 ³	—	—	0.5 [μs]	—	131.1 [ms]	—
fc	fc	fc (Note)	—	62.5 [ns]	—	16.4 [ms]	—
fs	fs	—	—	—	30.5 [μs]	—	8 [s]

Note: When fc is selected for the source clock in SLOW mode, the lower bits 11 of TREG1A is invalid, and a match of the upper bits 7 makes interrupts.

Figure 2.7.4 Timing chart for timer mode

(2) Event Counter mode

It is a mode to count up at the falling edge of the ECIN pin input. Both edges can not be used. The contents of TREG1A are compared with the contents of up-counter. If a match is found, an INTTC1 interrupt is generated, and the counter is cleared. Counting up resumes for ECIN pin input edge each after the counter is cleared. The maximum applied frequency is fc/2⁴ [Hz] in NORMAL 1/2 or IDLE 1/2 mode and fs/2⁴ [Hz] in SLOW or SLEEP mode. Two or more machine cycles are required for both the "H" and "L" levels of the pulse width.

Figure 2.7.5 Pulse width measurement mode timing chart

(3) Pulse Width Measurement mode

In this mode, pulse widths are counted on the rising edge of logical AND-ed product between ECIN pin input (window pulse) and the internal clock. The internal clock is selected by TC1CK (bit 2, 3 and 4 in TC1CR1). An INTTC1 interrupt is generated at the falling edge of the window pulse or both rising and falling edges of the window pulse, that can be selected by SGEDG (bit 4 in TC1CR2). In the interrupt service program, read the contents of TREG1A while the count is stopped (ECIN pin is low), then clear the counter using TC1C (bit 7 in TC1CR1). When the counter is not cleared, counting up resumes by starting count-up. When TREG1A is counted up from 3FFFFH to 00000H, an overflow occurs. HEOVF (bit 6 in TC1SR) of the status register can monitor whether the overflows or not. HEOVF remains the old data until the counter is required to be cleared by TC1C.

Figure 2.7.6 Pulse width measurement mode timing chart

Note 1: INTTC1 interrupt occurs when ECIN input is "1" and TC1S of TC1CR1 is written to "00". According to the following step, when timer counter is stopped, INTTC1 interrupt latch should be cleared to "0".

TC1STOP:

```

:      :
DI      ; Clear IMF
CLR    (EIRH). EF8      ; Clear EF8
LD     (TC1CR1), 00011010B ; Stop timer counter 1
LD     (ILH), 11111110B  ; Clear IL8
SET    (EIRH). EF8      ; Set EF8
EI      ; Set IMF
:      :

```

Note 2: When SGEDG (window gate pulse interrupt edge select) is set to both edges and ECIN pin input is "1" in the pulse width measurement mode, an INTTC1 interrupt is generated by setting TC1S (TC1 start control) to "10" (start).

Note 3: In the pulse width measurement mode, HECF (operating status monitor) cannot be used.

(4) Frequency Measurement mode

In this mode, the frequency of ECIN pin input pulse is measured. TC1CK is required to be set to the external clock. The edge of the input pulse is counted during “H” level of the window gate pulse selected by SGP (bit 5 and 6 in TC1CR2). Whether the input pulse is counted on the falling edge. An INTTC1 interrupt is generated on the falling edge or both the rising/falling edges of the window gate pulse, that can be selected by SGEDG (bit 4 in TC1CR2). To use ECNT terminal input as a window gate pulse, SGP (bit 5 and 6 in TC1CR2) should be set to “00”. In the interrupt service program, read the contents of TREG1A while the count is stopped (window gate pulse is low), then clear the counter using TC1C. When the counter is not cleared, counting up resumes by stating count-up. The window pulse status can be monitored by HECF of the status register. HEOVF of the status register can monitor whether the binary counter overflows or not. In the overflow flag status, a new data is not input until the counter clear requests.

- Using TC6 output ($\overline{\text{PWM6}}/\overline{\text{PDO6}}/\overline{\text{PPG6}}$) for the window gate pulse, external output of $\overline{\text{PWM6}}/\overline{\text{PDO6}}/\overline{\text{PPG6}}$ to P33 can be controlled using TC6OUT (bit 1 in TC1CR2). Zero-clearing TC6OUT outputs $\overline{\text{PWM6}}/\overline{\text{PDO6}}/\overline{\text{PPG6}}$ to P33; setting 1 in TC6OUT does not output $\overline{\text{PWM6}}/\overline{\text{PDO6}}/\overline{\text{PPG6}}$ to P33. (TC6OUT is used to control output to P33 only. Thus, use the timer counter 6 control register to operate/stop $\overline{\text{PWM6}}/\overline{\text{PDO6}}/\overline{\text{PPG6}}$.)
- When the internal window gate pulse is selected, the window gate pulse is set as follows. The internal window gate pulse consists of “H” level period (T_a) that is counting time and “L” level period (T_b) that is counting stop time. T_a or T_b can be individually set by TREG1B. One cycle contains $T_a + T_b$.

Note 1: Because the internal window gate pulse is generated in synchronization with the internal divider, it may be delayed for a maximum of one cycle of the source clock (WGPSCK) immediately after start of the timer.

Note 2: Set the internal window gate pulse when the timer counter is not operating or during the T_b period. When T_b is overwritten during the T_b period, the update is valid from the next T_b period.

Table 2.7.2 Setting T_a and T_b
($\text{WGPSCK} = 10$, $f_s = 32.768$ kHz)

Setting Value	Setting time	Setting Value	Setting time
0	31.25 ms	8	15.63 ms
1	29.30 ms	9	13.67 ms
2	27.34 ms	A	11.72 ms
3	25.39 ms	B	9.77 ms
4	23.44 ms	C	7.81 ms
5	21.48 ms	D	5.86 ms
6	19.53 ms	E	3.91 ms
7	17.58 ms	F	1.95 ms

Note 1: For 16-bit operation (16-bit Timer/Event Counter, Warming-up Counter, 16-bit PWM and 16-bit PPG), set its source clock on lower bits (TC3CK, TC5CK).

Note 2: i = 3, 4, 6 (8-bit mode)

i = 3 (16-bit mode)

Table 2.8.3 Restriction against the rate for comparing registers

Operating Mode	Authorized Rate for Register
8-Bit Timer/Event Counter	$1 \leq (TTREGn) \leq 255$
8-Bit PDO	$1 \leq (TTREGn) \leq 255$
8-Bit PWM	$2 \leq (PWREGn) \leq 254$
16-Bit Timer/Event Counter	$1 \leq (TTREG4, 3) \leq 65535, 1 \leq (TTREG6, 5) \leq 65535$
fc Warming-up Counter	$256 \leq (TTREG4, 3) \leq 65535, 256 \leq (TTREG6, 5) \leq 65535$
16-Bit PWM	$2 \leq (PWREG4, 3) \leq 65534, 2 \leq (PWREG6, 5) \leq 65534$
16-Bit PPG	$1 \leq (PWREG4, 3) < (TTREG4, 3) \leq 65535$ and $(PWREG4, 3) + 1 < (TTREG4, 3)$ $1 \leq (PWREG6, 5) < (TTREG6, 5) \leq 65535$ and $(PWREG6, 5) + 1 < (TTREG6, 5)$

Note: n = 3 to 6

2.8.3 Function

Timer/Counter 3, 4, 5 and 6 have eight operating modes: 8-bit timer, 8-bit external trigger timer, 8-bit programmable divider output mode, 8-bit pulse width modulation output mode, 16-bit timer, 16-bit external trigger timer, 16-bit pulse width modulation output mode, 16-bit programmable pulse generator output mode.

16-bit timer mode can use Timer counter 3 and 4 (5, 6) by cascade connection.

(1) 8-Bit Timer Mode (Timer/Counter 3, 4, 5 and 6)

In this mode, counting up is performed using the internal clock. The contents of TTREGi are compared with the contents of up-counter. If a match is found, an INTTCi interrupt is generated, and the counter is cleared to "0". Counting up resumes after the counter is cleared.

Note 1: In the timer mode, always write TCjCR<TFFj> to "0". If TFFj is set to "1", unexpected pulse may be output from PDOj /PWMj /PPGj pin.

Note 2: In the timer mode, do not change the setting of timer registers (TTREGi) while timer/counter is operating. Since TTREGi is configured as one-stage register, a newly set value is immediately reflected on the timer register.

Note 3: j = 3, 4, 6 i = 3 to 6

Table 2.8.4 Timer/Counter 1 source clock (internal clock)

Source Clock		SLOW1/2, SLEEP1/2 Modes	Resolution		Maximum Time Setting	
NORMAL1/2, IDLE1/2 Modes			At fc = 16 MHz	At fs = 32.768 kHz	At fc = 16 MHz	At fs = 32.768 kHz
DV7CK = 0	DV7CK = 0					
fc/2 ¹¹ [Hz]	fs/2 ³ [Hz]	fs/2 ³ [Hz]	128 [μs]	244.14 [μs]	32.6 [ms]	62.3 [ms]
fc/2 ⁷	fc/2 ⁷	—	8 [μs]	—	2.0 [ms]	—
fc/2 ⁵	fc/2 ⁵	—	2 [μs]	—	510 [μs]	—
fc/2 ³	fc/2 ³	—	500 [ns]	—	127.5 [μs]	—

Example: Sets the timer mode with source clock fc/2⁷ [Hz] and generates an interrupt 80 μs later (at fc = 16 MHz).

LDW (TTREG4), 0AH ; Sets the timer register (80 μs ÷ 2⁷/fc = 0AH)

DI

SET (EIRH). EF11 ; Enables INTTC4 interrupt

EI

LD (TC4CR), 00010000B ; Sets the 8-bit timer mode and source clock (fc/2⁷)

LD (TC4CR), 00011000B ; Starts TC4

Figure 2.8.7 8-bit timer mode timing chart (in case of timer/counter 4)

(2) 8-Bit Event Counter Mode (Timer/Counter 3, 4 and 6)

In this mode, events are counted on the falling edge of TCj pin input. The contents of TTREGj are compared with the contents of up-counter. If a match is found, an INTTCj interrupt is generated, and the counter is cleared. The maximum applied frequency is $f_c/2^4$ [Hz] in NORMAL1/2 or IDLE1/2 mode and $f_s/2^4$ [Hz] in SLOW1/2 or SLEEP1/2 mode. Two or more machine cycles are required for both the “H” and “L” levels of the pulse width.

Note 1: In the event counter mode, always write TCjCR<TFFj> to “0”. If TFFj is set to “1”, unexpected pulse may be output from $\overline{PDOj}$ / $\overline{PWMj}$ / $\overline{PPGj}$ pin.

Note 2: In the event counter mode, do not change the setting of timer registers (TTREGj) while timer/counter is operating. Since TTREGj is configured as one-stage register, a newly set value is immediately reflected on the timer register.

Note 3: j = 3, 4, 6

Figure 2.8.8 Event counter mode timing chart (in case of timer/counter 4)

(3) 8-Bit Programmable Divider Output (PDO) Mode (Timer/Counter 3, 4 and 6)

The internal clock is used for counting up. The contents of TTREGj are compared with the contents of the up-counter. Timer F/Fj output is toggled and the counter is cleared each time a match is found. Timer F/Fj output is inverted and output to the $\overline{\text{PDOj}}$ pin. When used as this mode, respective output latch should be set to "1". This mode can be used for 50% duty pulse output. Timer F/Fj can be initialized by program, and it is initialized to "0" during reset. An INTTCj interrupt is generated each time the $\overline{\text{PDOj}}$ output is toggled.

Example: Output a 1024 Hz pulse (at $f_c = 16.0 \text{ MHz} = "0"$, in case of TC4)

```
LD  (TTREG4), 3DH      ; (1/1024 ÷ 27/fc) ÷ 2 = 3DH
LD  (TC4CR), 00010001B ; Set the 8-bit PDO mode and source clock
                          (fc/27)
LD  (TC4CR), 00011001B ; Starts TC4
```

Note 1: In the programmable divider output(PDO) mode, do not change the setting of timer registers (TTREGj) while timer/counter is operating. Since TTREGj is configured as one-stage register, a newly set value is immediately reflected on the timer register.

Note 2: If PDO output is stopped during output operation, the output state is maintained at the state immediately before timer/counter is stopped. For changing the level of $\overline{\text{PDOj}}$ pin, modify TCjCR<TFFj> after timer/counter has been stopped. Do not execute halt of timer/counter and modification of TFFj simultaneously.

Example: Fixes $\overline{\text{PDOj}}$ output at high level after timer/counter is stopped

```
CLR  (TCjCR).3      ; Stops timer/counter.
CLR  (TCjCR).7      ; Sets  $\overline{\text{PDOj}}$  output to high level output
```

Note 3: i = 3, 4, 6

Figure 2.8.9 8-bit PDO mode timing chart (in case of timer/counter 4)

(4) 8-Bit Pulse Width Modulation (PWM) Output Mode (Timer/Counter 3, 4 and 6)

PWM output with a resolution of 8 bits is possible. The internal clock is used for counting up. The contents of PWREG_i are compared with the contents of up-counter. If a match is found, the timer F/F_i output is toggled. The counter continues counting. And, when an overflow occurs, the timer F/F_i output is again toggled and the counter is cleared. Timer F/F_i output is inverted and output to the PWM_i pin. An INTTC_i interrupt is generated when an overflow occurs.

In PWM mode, because PWREG_i becomes a 2-stage registers with shift register, it is possible to change the setting value of PWREG_i while timer/counter is operating. Therefore, output can be altered continuously. The shift operation of PWREG_i to shift register is executed at the INTTC_i timing. While timer/counter is operating, the data by read instruction is not a setting value of PWREG_i but a value of shift register. Therefore, after writing to PWREG_i, the reading data of PWREG_i is previous value till INTTC_i is generated.

While timer/counter stops, written value to PWREG_i is shifted to shift register immediately.

Note 1: In PWM mode, write to the timer register PWREG_i immediately after an INTTC_i interrupt is generated (normally during the INTTC_i interrupt service routine). If writing to PWREG_i and INTTC_i interrupt occur at the same time, the unstable value being written is shifted. This may cause pulses different from the set value to be output until the next INTTC_i interrupt is generated.

Note 2: If PWM output is stopped during output operation, the output state is maintained at the state immediately before timer/counter is stopped. For changing the level of PWM_i, modify TCiCR<TTF_i> after timer/counter has been stopped. Do not execute halt of timer/counter and modification of TTF_i simultaneously.

Example: Fixes PWM_i output at high level after timer/counter is stopped

CLR (TCiCR).3; Stops timer/counter.

CLR (TCiCR).7; Sets PWM_i output to high level output

Note 3: Before starting STOP mode, disable PWM output. When the timer/counter is enabled and fc, fc/2 or fs is selected as the source clock, pulse is output from PWM pin during warming-up after releasing STOP mode.

Note 4: $i = 3, 4, 6$

Figure 2.8.10 8-bit PWM mode timing chart (in case of timer/counter 4)

Table 2.8.5 PWM output mode

Source Clock			Resolution		Maximum Setting Time	
NORMAL1/2, IDLE1/2 Mode		SLOW1/2, SLEEP1/2 Mode	fc = 16 MHz	fs = 32.768 kHz	fc = 16 MHz	fs = 32.768 kHz
DV7CK = 0	DV7CK = 1					
fc/2 ¹¹ [Hz]	fs/2 ³ [Hz]	fs/2 ³ [Hz]	128 [μs]	244.14 [μs]	32.8 [ms]	62.5 [ms]
fc/2 ⁷	fc/2 ⁷	—	8 [μs]	—	2.05 [ms]	—
fc/2 ⁵	fc/2 ⁵	—	2 [μs]	—	512 [μs]	—
fc/2 ³	fc/2 ³	—	500 [ns]	—	128 [μs]	—
fs	fs	fs	30.5 [μs]	30.5 [μs]	7.81 [ms]	78.1 [ms]
fc/2	fc/2	—	125 [ns]	—	32 [μs]	—
fc	fc	—	62.5 [ns]	—	16 [μs]	—

(5) 16-Bit Timer Mode (Timer/counter 3 and 4, Timer/counter 5 and 6)

In this mode, counting up is performed using the internal clock.

Timer/counter 3 and 4 (5 and 6) are also available as a 16-bit timer mode by cascade connection.

a. 16-bit timer mode of Timer/counter 3 and 4

If a match is found, the INTTC4 interrupt is generated and the counter is cleared to “0”. Counting up resumes after the counter is cleared. The timer register should write to the TTREG3 more first than TTREG4. The timer register must not write only either TTREG3 or TTREG4.

b. 16-bit timer mode of Timer/counter 5 and 6

If a match is found, the INTTC6 interrupt is generated and the counter is cleared to “0”. Counting up resumes after the counter is cleared. The timer register should write to the TTREG5 more first than TTREG6. The timer register must not write only either TTREG5 or TTREG6.

Note 1: In the timer mode, always write TCjCR<TFFj> to “0”. If TFFj is set to “1”, unexpected pulse may be output from PDoj / PWMj / PPGj pin.

Note 2: In the timer mode, do not change the setting of timer registers (TTREGi) while timer/counter is operating. Since TTREGi is configured as one-stage register, a newly set value is immediately reflected on the timer register.

Note 3: j = 3, 4, 6 i = 3 to 6

Table 2.8.6 Source clock of 16-bit timer mode

Source Clock			Resolution		Maximum Setting Time	
NORMAL1/2, IDLE1/2 Mode		SLOW1/2, SLEEP1/2 Mode	fc = 16 MHz	fs = 32.768 kHz	fc = 16 MHz	fs = 32.768 kHz
DV7CK = 0	DV7CK = 1					
fc/2 ¹¹ [Hz]	fs/2 ³ [Hz]	fs/2 ³	128 [μs]	244.14 [μs]	8.39 [s]	16 [s]
fc/2 ⁷	fc/2 ⁷	—	8 [μs]	—	524.3 [ms]	—
fc/2 ⁵	fc/2 ⁵	—	2 [μs]	—	131.1 [μs]	—
fc/2 ³	fc/2 ³	—	500 [ns]	—	32.8 [μs]	—

Example: Set the 16-bit timer mode with source clock $fc/2^7$ [Hz] and generates an interrupt 300 [ms] later (at $fc = 16$ [MHz])

```
LDW (TTREG3), 927CH    ; Sets the timer register
                        (300 ms ÷  $2^7/fc = 927CH$ )

DI
SET (EIRH), EF11      ; Enable INTTC4 interrupt
EI
LD (TC3CR), 13H        ; Sets the 16-bit timer mode (lower) and
                        source clock
LD (TC4CR), 04H        ; Sets the 16-bit timer mode (upper)
LD (TC4CR), 0CH        ; Starts timer/counter
```

Figure 2.8.11 16-bit timer mode timing chart (in case of timer/counter 3 and 4)

(6) 16-Bit Event Counter Mode (Timer/counter 3 and 4)

In this mode, event are counted on the falling edge of the TC3 pin input. Timer/counter 5 and 6 can not use a 16-bit Event Counter Mode. Timer/counter 3 and 4 are also available as a 16-bit Event counter mode by cascade connection.

a. 16-bit event counter mode of Timer/counter 3 and 4

If a match is found, the INTTC4 interrupt is generated and the counter is cleared to "0". After the counter is cleared, counting up resumes every falling edge of TC3 input. The maximum applied frequency is $fc/2^4$ [Hz] in NORMAL1/2 or IDLE1/2 mode and $fs/2^4$ [Hz] in SLOW1/2 or SLEEP1/2 mode. Two or more machine cycles are required for both the "H" and "L" levels of the pulse width. The timer register should write to the TTREG3 more first than TTREG4. The timer register must not write only either TTREG3 or TTREG4.

Note 1: In the event counter mode, always write TCjCR<TFFj> to "0". If TFFj is set to "1", unexpected pulse may be output from $\overline{PDOj}$ / $\overline{PWMj}$ / $\overline{PPGj}$ pin.

Note 2: In the event counter mode, do not change the setting of timer registers (TTREGj) while timer/counter is operating. Since TTREGj is configured as one-stage register, a newly set value is immediately reflected on the timer register.

Note 3: $j = 3, 4$

(7) 16-Bit Pulse Width Modulation (PWM) Output Mode
(Timer/counter 3 and 4, Timer/counter 5 and 6)

PWM output with a resolution of 16 bits is possible. Timer/counter 3 and 4 (5 and 6) are also available as a 16-bit PWM output mode by cascade connection.

a. 16-bit PWM output mode of Timer/counter 3 and 4

The contents of PWREG3/4 are compared with the contents of up-counter. If a match is found, the timer F/F4 output is toggled. The counter continues counting. And, when an overflow occurs, the timer F/F4 output is again toggled and the counter is cleared. Timer F/F4 output is inverted and output to the $\overline{\text{PWM4}}$ pin. An INTTC4 interrupt is generated when an overflow occurs. When used as $\overline{\text{PWM4}}$ pin, respective output latch should be set to "1". In PWM mode, because PWREG4/3 each becomes a 2-stage registers with shift register, it is possible to change the setting value of PWREG4/3 while timer/counter is operating. Therefore, output can be altered continuously. The shift operation of PWREG4/3 to shift register is executed at the INTTC4 timing. While timer/counter is operating, the data by read instruction is not a setting value of PWREG4/3 but a value of shift register. Therefore, after writing to PWREG4/3, the reading data of these registers is previous value till INTTC4 is generated.

While timer/counter stops, written value to PWREG4/3 is shifted to shift register immediately. When writing to PWREG4/3, always write to the lower side (PWREG3) and then the upper side (PWREG4) in that order. Writing to only lower side (PWREG3) or the upper side (PWREG4) has no effect.

b. 16-bit PWM output mode of Timer/counter 5 and 6

The contents of PWREG5/6 are compared with the contents of up-counter. If a match is found, the timer F/F6 output is toggled. The counter continues counting. And, when an overflow occurs, the timer F/F6 output is again toggled and the counter is cleared. Timer F/F6 output is inverted and output to the $\overline{\text{PWM6}}$ pin. An INTTC6 interrupt is generated when an overflow occurs. When used as $\overline{\text{PWM6}}$ pin, respective output latch should be set to "1". In PWM mode, because PWREG6/5 each becomes a 2-stage registers with shift register, it is possible to change the setting value of PWREG6/5 while timer/counter is operating. Therefore, output can be altered continuously. The shift operation of PWREG6/5 to shift register is executed at the INTTC6 timing. While timer/counter is operating, the data by read instruction is not a setting value of PWREG6/5 but a value of shift register. Therefore, after writing to PWREG6/5, the reading data of these registers is previous value till INTTC6 is generated.

While timer/counter stops, written value to PWREG6/5 is shifted to shift register immediately. When writing to PWREG6/5, always write to the lower side (PWREG5) and then the upper side (PWREG6) in that order. Writing to only lower side (PWREG5) or the upper side (PWREG6) has no effect.

Note 1: In PWM mode, write to the timer register PWREGm,n immediately after an INTTCm interrupt is generated (normally during the INTTCm interrupt service routine). If writing to PWREGm, n and INTTCm interrupt occur at the same time, the unstable value being written is shifted. This may cause pulses different from the set value to be output until the next INTTCm interrupt is generated.

Note 2: If PWM output is stopped during output operation, the output state is maintained at the state immediately before timer/counter is stopped. For changing the level of $\overline{\text{PWMi}}$, modify TCiCR<TFFi> after timer/counter has been stopped. Do not execute halt of timer/counter and modification of TFFi simultaneously.

Example: Fixes $\overline{\text{PWMi}}$ output at high level after timer/counter is stopped
 CLR (TCiCR).3; Stops timer/counter
 CLR (TCiCR).7; Sets $\overline{\text{PWMi}}$ output to high level output

Note 3: Before starting STOP mode, disable PWM output. When the timer/counter is enabled and fc, fc/2 or fs is selected as the source clock, pulse is output from PWM pin during warming-up after releasing STOP mode.

Note 4: m = 4 and n = 3, or m = 6 and n = 5. i = 4, 6.

Table 2.8.7 16-bit PWM output mode

Source Clock		SLOW, SLEEP Mode	Resolution		Maximum Setting Time	
NORMAL1/2, IDLE1/2 Mode			fc = 16 MHz	fs = 32.768 kHz	fc = 16 MHz	fs = 32.768 kHz
DV7CK = 0	DV7CK = 1					
fc/2 ¹¹	fs/2 ³ [Hz]	fs/2 ³	128 [μs]	244.14 [μs]	8.39 [s]	16 [s]
fc/2 ⁷	fc/2 ⁷	—	8 [μs]	—	524.3 [ms]	—
fc/2 ⁵	fc/2 ⁵	—	2 [μs]	—	131.1 [ms]	—
fc/2 ³	fc/2 ³	—	500 [ns]	—	32.8 [ms]	—
fs	fs	fs	30.5 [μs]	30.5 [μs]	2 [s]	2 [s]
fc/2	fc/2	—	125 [ns]	—	8.2 [ms]	—
fc	fc	—	62.5 [ns]	—	4.1 [ms]	—

Example: Extract the pulse, whose term and “high” width is 32.768 ms and 1 ms respectively, from P32 width 16-bit PWM mode
 (at fc = 16 MHz = “0”, DV7CK = 0)

LDW (PWREG3), 07D0H ; Sets pulse width
 LD (TC3CR), 33H ; Sets the 16-bit PWM mode (lower) and source clock (fc/2³)
 LD (TC4CR), 056H ; Sets the TFF4 to “0” and sets the 16-bit PWM mode (upper)
 LD (TC4CR), 05EH ; Starts timer/counter

Figure 2.8.12 16-bit PWM mode timing chart (in case of timer/counter 3 and 4)

(8) 16-Bit Programmable Pulse Generate (PPG) output mode
(Timer/counter 3 and 4, Timer/counter 5 and 6)

PPG output with a resolution of 16 bits is possible. Timer/counter 3 and 4 (5 and 6) are also available as a 16-bit PPG output mode by cascade connection.

a. 16-bit PPG output mode of Timer/counter 3 and 4

First, the contents of PWREG3/4 are compared with the contents of up-counter. If a match is found, the timer F/F4 output is toggled. Next, timer F/F4 is again toggled and the counter is cleared by matching with TTREG3/4. The INTTC4 interrupt is generated at this time.

When used as PPG4 pin, respective output latch should be set to "1". During reset, the F/F4 is initialized to "0".

The F/F4 output is configured by TC4CR<TFF4>. Therefore, the PPG4 can output either output high or output low at first time. The timer register should write to the PWREG3/TTREG3 more first than PWREG4/TTREG4. The timer register must not write only either PWREG3/TTREG3 or PWREG4/TTREG4.

b. 16-bit PPG output mode of Timer/counter 5 and 6

First, the contents of PWREG5/6 are compared with the contents of up-counter. If a match is found, the timer F/F6 output is toggled. Next, timer F/F6 is again toggled and the counter is cleared by matching with TTREG5/6. The INTTC6 interrupt is generated at this time.

When used as PPG6 pin, respective output latch should be set to "1". During reset, the F/F6 is initialized to "0".

The F/F6 output is configured by TC6CR<TFF6>. Therefore, the PPG6 can output either output high or output low at first time. The timer register should write to the PWREG5/TTREG5 more first than PWREG6/TTREG6. The timer register must not write only either PWREG5/TTREG5 or PWREG6/TTREG6.

Example: Extract the pulse, whose term and "high" width is 16.385 ms and 1 ms respectively, from P32 with 16-bit PPG mode (at $f_c = 16.0$ MHz, $DV7CK = 0$)

```
SET (P3DR).2 ; Sets P32 output data latch to "1"
LDW (PWREG3), 07D0H ; Sets pulse width
LDW (TTREG3), 8002H ; Sets pulse term
LD (TC3CR), 33H ; Sets the 16-bit PPG mode (lower) and
; source clock ( $f_c/2^3$ )
LD (TC4CR), 057H ; Sets the TFF4 to "0" and sets the 16-bit
; PPG mode(upper)
LD (TC4CR), 05FH ; Starts timer/counter
```

Note 1: In the programmable pulse generate (PPG) mode, do not change the setting of timer registers (PWREGi, TTREGi) while timer/counter is operating. Since PWREGi, TTREGi are configured as one-stage register, a newly set value is immediately reflected on the timer register.

Note 2: If PPG output is stopped during output operation, the output state is maintained at the state immediately before timer/counter is stopped. For changing the level of PPGj, modify TCiCR<TFFi> after timer/counter has been stopped. Do not execute halt of timer/counter and modification of TFFj simultaneously.

Example: Fixes PPGj output at high level after timer/counter is stopped

CLR (TCjCR).3; Stops timer/counter

CLR (TCjCR).7; Sets PPGj output to high level output

Note 3: j = 4, 6 i = 3 to 6

Figure 2.8.13 16-bit PPG mode timing chart (in case of timer/counter 3 and 4)

(9) Warming-up counter mode

In this mode, the warming-up period for switching the main system clock can be generated. Timer/counter 3 and 4 (5 and 6) are used as a 16-bit timer by cascade connection.

There are 2 modes in warming-up counter mode, one is a mode from NORMAL to SLOW and the other is a mode from SLOW to NORMAL.

Note 1: In the warming-up mode, always write TCiCR<TFFi> to "0". If TFFi is set to "1", unexpected pulse may be output from PDOi / PWMi / PPGi pin.

Note 2: In the warming-up mode, the lower 11 bits of TTREGm,n are ignored and an interrupt is generated by matching the upper 5 bits.

Note 3: i = 3, 4, 6 m = 4 and n = 3, or m = 6 and n = 5

a. Warming-up counter mode for low-frequency
(NORMAL1 → NORMAL2 → SLOW2 → SLOW1)

In this mode, it can obtain the warming-up period till the oscillation for low-frequency (fs) is stabilized.

Before timer/counter is started, turn on low-frequency oscillation by setting SYSCR2<XTEN> to "1".

After timer/counter is started by setting TCmCR<TCmS>, the contents of TTREGm, n are compared with the contents of up-counter. If a match is found, an INTTCm interrupt is generated, and the counter is cleared to "0".

In the interrupt service program, stop the timer/counter and change the system clock to low-frequency clock by setting SYSCR2<SYSCK> to "1".

After that, halt the high-frequency oscillation by clearing SYSCR2<XEN> to "0".

Table 2.8.8 Warming-up period for low-frequency oscillation (at fs = 32.768 kHz)

Min(at TTREGm, n = 0100H)	Max (at TTREGm, n = FF00H)
7.81 ms	1.99 s

Example: Switching to the SLOW1 mode after low-frequency clock has stabilized by using TC4, 3.

```

SET (SYSCR2).6 ; SYSCR2<XTEN> ← "1"
LD (TC3CR).43H ; TFF3 = "0", fs for source clock, sets 16-bit
mode
LD (TC4CR).05H ; TFF4 = "0", sets warming-up counter
mode
LD (TTREG3).8000H ; sets warming-up time
(depend on oscillator characteristics)
DI ; IMF ← "0"
SET (EIRH).3 ; Enables INTTC4
EI ; IMF ← "1"
SET (TC4CR).3 ; Starts TC4, 3
⋮
PINTTC4: CLR (TC4CR).3 ; Stops TC4, 3
SET (SYSCR2).5 ; SYSCR2<SYSCK> ← "1"
(Switches the main system clock to the
low-frequency clock)
CLR (SYSCR2).7 ; SYSCR2<XEN> ← "0"
(Turns off low-frequency oscillation)

```

- b. Warming-up counter mode for high-frequency
(SLOW1 → SLOW2 → NORMAL2 → NORMAL1)

In this mode, it can obtain the warming-up period till the oscillation for high-frequency (fc) is stabilized.

Before timer/counter is started, turn on high-frequency oscillation by setting SYSCR2<XEN> to "1".

After timer/counter is started by setting TCmCR<TCmS>, the contents of TTREGm,n are compared with the contents of up-counter. If a match is found, an INTTCm interrupt is generated, and the counter is cleared to "0".

In the interrupt service program, stop the timer/counter and change the system clock to high-frequency clock by clearing SYSCR2<SYSCK> to "0".

After that, halt the low-frequency oscillation by clearing SYSCR2<XTEN> to "0".

Table 2.8.9 Warming-up period for high-frequency (at fc = 16 MHz)

Min (at TTREGm, n = 0100H)	Max (at TTREGm, n = FF00H)
16 μ s	4.08 ms

Example: Switching to the NORMAL1 mode after high-frequency clock has stabilized by using TC4, 3.

2.9 UART (Asynchronous Serial Interface)

The TMP86FM29 has 1 channel of UART (asynchronous serial interface).

The UART is connected to external devices via RxD and TxD. RxD is also used as P15; TxD, as P16. To use P15 or P16 as the RxD or TxD pin, set P1 port output latches to “1”.

2.9.1 Configuration

Figure 2.9.1 UART

2.9.2 Control

UART is controlled by the UART control registers (UARTCR1, UARTCR2). The operating status can be monitored using the UART status register (UARTSR).

UART control register

UARTCR1 (0025 _H)	7	6	5	4	3	2	1	0	
	TXE	RXE	STBT	EVEN	PE		BRG		(Initial value: 0000 0000)

BRG	Transmit clock select	000: fc/13 [Hz] 001: fc/26 010: fc/52 011: fc/104 100: fc/208 101: fc/416 110: TC5 (INTTC5) 111: fc/96	Write only
PE	Parity addition	0: No parity 1: Parity	
EVEN	Even-numbered parity	0: Odd-numbered parity 1: Even-numbered parity	
STBT	Transmit stop bit length	0: 1 bit 1: 2 bits	
RXE	Receive operation	0: Disable 1: Enable	
TXE	Transfer operation	0: Disable 1: Enable	

Note 1: When operations are disabled by setting TXE and RXE bit to "0", the setting becomes valid when data transmit or receive complete. When the transmit data is stored in the transmit data buffer, the data are not transmitted. Even if data transmit is enabled, until new data are written to the transmit data buffer, the current data are not transmitted.

Note 2: The transmit clock and the parity are common to transmit and receive.

Note 3: UARTCR1<RXE> and UARTCR1<TXE> should be set to "0" before UARTCR1<BRG> is changed

UARTCR2 (0026 _H)	7	6	5	4	3	2	1	0	
						RXDNC	STOPBR		(Initial value: **** *000)

STOPBR	Receive stop bit length	0: 1 bit 1: 2 bits	Write only
RXDNC	Selection of RxD input noise rejection time	00: No noise rejection (hysteresis input) 01: Rejects pulses shorter than 31/fc [s] as noise 10: Rejects pulses shorter than 63/fc [s] as noise 11: Rejects pulses shorter than 127/fc [s] as noise	

Note: When UARTCR2<RXDNC> = "01", pulses longer than 96/fc [s] are always regarded as signals; when UARTCR2<RXDNC> = "10", longer than 192/fc [s]; and when UARTCR2<RXDNC> = "11", longer than 384/fc [s]

Figure 2.9.2 UART control register

Figure 2.9.3 UART status register and data buffer registers

2.9.3 Transfer Data Format

In UART, a one-bit start bit (low level), stop bit (bit length selectable at high level, by UARTCR1<STBT>), and parity (select parity in UARTCR1<PE>; even-or odd-numbered parity by UARTCR1<EVEN>) are added to the transfer data. The transfer data formats are shown as follow.

Table 2.9.1 Transfer data format

PE	STBT	Frame length									
		1	2	3	-----	8	9	10	11	12	
0	0										
0	1										
1	0										
1	1										

Note: In order to switch the transmit data format, perform transmit operations in the following sequence except for the initial setting.

2.9.4 Transfer Rate

The baud rate of UART is set of UARTCR1<BRG>. The example of the baud rate shown as follows.

Table 2.9.2 Transfer rate

BRG	Source Clock		
	16 MHz	8 MHz	4 MHz
000	76800 [baud]	38400 [baud]	19200 [baud]
001	38400	19200	9600
010	19200	9600	4800
011	9600	4800	2400
100	4800	2400	1200
101	2400	1200	600

When TC5 is used as the UART transfer rate (when UARTCR1<BRG> = "110"), the transfer clock and transfer rate are determined as follows:

$$\text{Transfer clock} = \frac{\text{TC5 source clock}}{\text{TTREG5 set value}}$$

$$\text{Transfer rate} = \frac{\text{Transfer clock}}{16}$$

2.9.5 Data Sampling

The UART receiver keeps sampling input using the clock selected by UARTCR1<BRG> until a start bit is detected in RxD pin input. RT clock starts detecting "L" level of the RxD pin. Once a start bit is detected, the start bit, data bits, stop bit(s), and parity bit are sampled at three times of RT7, RT8, and RT9 during one receiver clock interval (RT clock). (RT0 is the position where the bit supposedly starts). Bit is determined according to majority rule (the data are the same twice or more out of three samplings).

Figure 2.9.4 Data sampling

2.9.6 STOP Bit Length

Select a transmit stop bit length (1 or 2 bits) by UARTCR1<STBT>.

2.9.7 Parity

Set parity/no parity by UARTCR1<PE>; set parity type (odd-or even-numbered) by UARTCR1<EVEN>.

2.9.8 Transmit/Receive

(1) Data transmit

Set UARTCR1<TXE> to "1". Read UARTSR to check UARTSR<TBEP> = "1", then write data in TDBUF (transmit data buffer). Writing data in TDBUF zero-clears UARTSR<TBEP>, transfers the data to the transmit shift register and the data are sequentially output from the TxD pin. The data output include a one-bit start bit, stop bits whose number is specified in UARTCR1<STBT> and a parity bit if parity addition is specified. Select the data transfer baud rate using bits 0 to 2 in UARTCR1. When data transmit starts, transmit buffer empty flag UARTSR<TBEP> is set to "1" and an INTTXD interrupt is generated.

While UARTCR1<TXE> = "0" and from when "1" is written to UARTCR1<TXE> to when send data are written to TDBUF, the TXD pin is fixed at High level. When transmitting data, first read UARTSR, then write data in TDBUF. Otherwise, UARTSR<TBEP> is not zero-cleared and transmit does not start.

(2) Data receive

Set UARTCR1<RXE> to "1". When data are received via the RxD pin, the receive data are transferred to RDBUF (receive data buffer). At this time, the data transmitted include a start bit and stop bit(s) and a parity bit if parity addition is specified. When stop bit(s) are received, data only are extracted and transferred to RDBUF (receive data buffer). Then the receive buffer full flag UARTSR<RBFL> is set and an INTRXD interrupt is generated. Select the data transfer baud rate using bits 0 to 2 in UARTCR1.

If an overrun error (OERR) occurs when data are received, the data are not transferred to RDBUF (receive data buffer) but discarded; data in the RDBUF are not affected.

Note: When a receive operation is disabled by setting UARTCR1<RXE> bit to "0", the setting becomes valid when data receive is completed. However, if a framing error occurs in data receive, the receive-disabling setting may not become valid. If a framing error occurs, be sure to perform a re-receive operation.

2.9.9 Status Flag/Interrupt Signal

(1) Parity error

When parity determined using the receive data bits differs from the received parity bit, the parity error flag UARTSR<PERR> is set to “1”. The UARTSR<PERR> is cleared to “0” when the RDBUF is read after reading the UARTSR.

Figure 2.9.5 Generation of parity error

(2) Framing error

When “0” is sampled as the stop bit in the receive data, framing error flag UARTSR<FERR> is set to “1”. The UARTSR<FERR> is cleared to “0” when the RDBUF is read after reading the UARTSR.

Figure 2.9.6 Generation of framing error

(3) Overrun error

When all bits in the next data are received while unread data are still in RDBUF, overrun error flag UARTSR<OERR> is set to "1". In this case, the receive data is discarded; data in RDBUF are not affected. The UARTSR<OERR> is cleared to "0" when the RDBUF is read after reading the UARTSR.

Figure 2.9.7 Generation of overrun error

(4) Receive data buffer full

Loading the received data in RDBUF sets receive data buffer full flag UARTSR<RBFL>. The UARTSR<RBFL> is cleared to "0" when the RDBUF is read after reading the UARTSR.

Figure 2.9.8 Generation of receive buffer full

(5) Transmit data buffer empty

When no data is in the transmit buffer TDBUF, UARTSR<TBEP> is set to “1”, that is, when data in TDBUF are transferred to the transmit shift register and data transmit starts, transmit data buffer empty flag UARTSR<TBEP> is set to “1”. The UARTSR<TBEP> is cleared to “0” when the TDBUF is written after reading the UARTSR.

Figure 2.9.9 Generation of transmit buffer empty

(6) Transmit end flag

When data are transmitted and no data is in TDBUF (UARTSR<TBEP> = “1”), transmit end flag UARTSR<TEND> is set to “1”. The UARTSR<TEND> is cleared to “0” the data transmit is stated after writing the TDBUF.

Figure 2.9.10 Generation of transmit buffer empty

2.10 Serial Interface (SIO)

The TMP86FM29 has one clocked-synchronous 8-bit serial interface. Serial interface has an 8-byte transmit and receive data buffer that can automatically and continuously transfer up to 64 bits of data.

The serial interface is connected to external devices via pins P16 (SO), P15 (SI), P17 ($\overline{SCK}$). The serial interface pins are also used as port P1. When these pins are used as serial interface pins, the correspondence output latch should be set to "1". In the transmit mode, pin P15 can be used as normal I/O port, and in the receive mode, the pin P16 can be used as normal I/O ports.

2.10.1 Configuration

Figure 2.10.1 Serial interfaces

2.10.2 Control

The serial interface is controlled by SIO control registers (SIOCR1/SIOCR2). The serial interface status can be determined by reading SIO status register (SIOSR).

The transmit and receive data buffer is controlled by the SIOCR2<BUF>. The data buffer is assigned to address 0F90H to 0F97H for SIO in the DBR area, and can continuously transfer up to 8 words (bytes or nibbles) at one time. When the specified number of words has been transferred, a buffer empty (in the transmit mode) or a buffer full (in the receive mode or transmit/receive mode) interrupt (INTSIO) is generated.

When the internal clock is used as the serial clock in the 8-bit receive mode and the 8-bit transmit/receive mode, a fixed interval wait can be applied to the serial clock for each word transferred. Four different wait times can be selected with SIOCR2<WAIT>.

SIO Control Register 1

SIOCR1	7	6	5	4	3	2	1	0
(0F98 _H)	SIOS	SIOINH		SIOM			SCK	

(Initial value: 0000 0000)

		010	$fc/2^7$	$fc/2^7$	—	
		011	$fc/2^6$	$fc/2^6$	—	
		100	$fc/2^5$	$fc/2^5$	—	
		101	$fc/2^4$	$fc/2^4$	—	
110	Reserved		—			
111	External clock (input from SCK pin)					

Note 1: fc; High-frequency clock [Hz] fs; Low-frequency clock [Hz]

Note 2: Set SIOS to "0" and SIOINH to "1" when setting the transfer mode or serial clock.

Note 3: SIOCR1 is write-only register, which cannot access any of in-read-modify-write instruction such as bit operate, etc.

SIO Status Register

SIOSR	7	6	5	4	3	2	1	0
(0F99 _H)	SIOF	SEF						

(Initial value: 00** ****)

SIOF	Serial transfer operating status monitor	0: Transfer terminated 1: Transfer in process	Read only
SEF	Shift operating status monitor	0: Shift operation terminated 1: Shift operation in process	

Note 1: The SIO1SR<SIOF> bit is cleared to "0" by clearing SIO1CR1<SIOS> to stop transferring or by setting SIO1CR1<SIOINH> to "1" to abort transfer.

Figure 2.10.2 SIO control register and status register (1/2)

Figure 2.10.3 SIO control register and status register (2/2)

(1) Serial clock

a. Clock Source

SIOCR1<SCK> is able to select the following:

1. Internal clock

Any of four frequencies can be selected. The serial clock is output to the outside on the $\overline{\text{SCK}}$ pin. The $\overline{\text{SCK}}$ pin goes high when transfer starts.

When data writing (in the transmit mode) or reading (in the receive mode or the transmit/receive mode) cannot keep up with the serial clock rate, there is a wait function that automatically stops the serial clock and holds the next shift operation until the read/write processing is completed.

Table 2.10.1 Serial clock rate

SCK	NORMAL1/2, IDLE1/2 Modes				SLOW, SLEEP Modes	
	DV7CK = 0		DV7CK = 1		Clock	Baud Rate
000	fc/2 ¹³	1.91 Kbps	fs/2 ⁵	1024 bps	fs/2 ⁵	1024 bps
001	fc/2 ⁸	61.04 Kbps	fc/2 ⁸	61.04 Kbps	—	—
010	fc/2 ⁷	122.07 Kbps	fc/2 ⁷	122.07 Kbps	—	—
011	fc/2 ⁶	244.14 Kbps	fc/2 ⁶	244.14 Kbps	—	—
100	fc/2 ⁵	488.28 Kbps	fc/2 ⁵	488.28 Kbps	—	—
101	fc/2 ⁴	976.56 Kbps	fc/2 ⁴	976.56 Kbps	—	—
110	—	—	—	—	—	—
111	External	—	External	—	External	—

1 Kbit = 1024 bit
(fc = 16 MHz, fs = 32.768 kHz)

Figure 2.10.4 Wait function (example: 4-bit serial transfer)

2. External clock

An external clock connected to the $\overline{\text{SCK}}$ pin is used as the serial clock. In this case, the P17 ($\overline{\text{SCK}}$) output latch must be set to "1". To ensure shifting, both the high and low levels of the serial clock pulse width must be at least 4 machine cycles. This pulse is needed for the shift operation to execute certainly. Therefore, the maximum available transfer rate is 488.3 Kbits/s when the operation frequency is fc=16MHz.

Note: tcyc = 4/fc (In NORAML1/2, IDLE1/2 modes)
4/fs (In SLOW1/2, SLEEP1/2 modes)

b. Shift edge

The leading edge is used to transmit, and the trailing edge is used to receive.

1. Leading edge

Transmitted data are shifted on the leading edge of the serial clock (falling edge of the $\overline{\text{SCK}}$ pin input/output).

2. Trailing edge

Received data are shifted on the trailing edge of the serial clock (rising edge of the $\overline{\text{SCK}}$ pin input/output).

Figure 2.10.5 Shift edge

(2) Number of bits to transfer

Either 4-bit or 8-bit serial transfer can be selected. When 4-bit serial transfer is selected, only the lower 4 bits of the transmit/receive data buffer register are used. The upper 4 bits are cleared to "0" when receiving.

The data is transferred in sequence starting at the least significant bit (LSB).

(3) Number of words to transfer

Up to 8 words consisting of 4 bits of data (4-bit serial transfer) or 8 bits (8-bit serial transfer) of data can be transferred continuously. The number of words to be transferred is loaded to SIOCR2<BUF>.

An INTSIO interrupt is generated when the specified number of words has been transferred. If the number of words is to be changed during transfer, the serial interface must be stopped before making the change. The number of words can be changed during automatic-wait operation of an internal clock. In this case, the serial interface is not required to be stopped.

Figure 2.10.6 Number of bits to transfer (example: 4-bit serial transfer)

2.10.3 Transfer Mode

SIOCR1<SIOM> is used to select the transmit, receive, or transmit/receive mode.

(1) 4-bit and 8-bit Transmit Modes

In these modes, the SIOCR1 is set to the transmit mode and then the data to be transmitted first are written to the data buffer registers (DBR). After the data are written, the transmission is started by setting SIOCR1<SIOS> to "1". The data are then output sequentially to the SO pin in synchronous with the serial clock, starting with the least significant bit (LSB). As soon as the LSB has been output, the data are transferred from the data buffer register to the shift register. When the final data bit has been transferred and the data buffer register is empty, an INTSIO (buffer empty) interrupt is generated to request the next transmitted data.

When the internal clock is used, the serial clock will stop and an automatic-wait will be initiated if the next transmitted data are not loaded to the data buffer register by the time the number of data words specified with the SIOCR2<BUF> has been transmitted. Writing even one word of data cancels the automatic-wait; therefore, when transmitting two or more words, always write the next word before transmission of the previous word is completed.

Note: Automatic-waits are also canceled by writing to a DBR not being used as a transmit data buffer register; therefore, during SIO do not use such DBR for other applications. For example, when 3 words are transmitted, do not use the DBR of the remained 5 words.

When an external clock is used, the data must be written to the data buffer register before shifting next data. Thus, the transfer speed is determined by the maximum delay time from the generation of the interrupt request to writing of the data to the data buffer register by the interrupt service program.

The transmission is ended by clearing SIOCR1<SIOS> to "0" or setting SIOCR1<SIOINH> to "1" in buffer empty interrupt service program. That the transmission has ended can be determined from the status of SIOSR<SIOF> because SIOSR<SIOF> is cleared to "0" when a transfer is completed.

When SIOCR1<SIOINH> is set, the transmission is immediately ended and SIOSR<SIOF> is cleared to "0".

When an external clock is used, it is also necessary to clear SIOCR1<SIOS> to "0" before shifting the next data; otherwise, dummy data will be transmitted and the operation will end.

If it is necessary to change the number of words, SIOCR1<SIOS> should be cleared to "0", then SIOCR2<BUF> must be rewritten after confirming that SIOSR<SIOF> has been cleared to "0".

Figure 2.10.7 Transfer mode (example: 8-bit, 1 word transfer)

Figure 2.10.8 Transmitted data hold time at end of transmit

(2) 4-bit and 8-bit receive modes

After setting the control registers to the receive mode, set SIOCR1<SIOS> to “1” to enable receiving. The data are then transferred to the shift register via the SI pin in synchronous with the serial clock. When one word of data has been received, it is transferred from the shift register to the data buffer register (DBR). When the number of words specified with the SIOCR2<BUF> has been received, an INTSIO (buffer full) interrupt is generated to request that these data be read out. The data are then read from the data buffer registers by the interrupt service program.

When the internal clock is used, and the previous data are not read from the data buffer register before the next data are received, the serial clock will stop and an automatic-wait will be initiated until the data are read. A wait will not be initiated if even one data word has been read.

Note: Waits are also canceled by reading a DBR not being used as a received data buffer register is read; therefore, during SIO do not use such DBR for other applications.

When an external clock is used, the shift operation is synchronized with the external clock; therefore, the previous data are read before the next data are transferred to the data buffer register. If the previous data have not been read, the next data will not be transferred to the data buffer register and the receiving of any more data will be canceled. When an external clock is used, the maximum transfer speed is determined by the delay between the time when the interrupt request is generated and when the data received have been read.

The receiving is ended by clearing SIOCR1<SIOS> to “0” or setting SIOCR1<SIOINH> to “1” in buffer full interrupt service program. When SIOCR1<SIOS> is cleared, the current data are transferred to the buffer. After SIOCR1<SIOS> cleared, the receiving is ended at the time that the final bit of the data has been received. That the receiving has ended can be determined from the status of SIOSR<SIOF>. SIOSR<SIOF> is cleared to “0” when the receiving is ended. After confirmed the receiving termination, the final receiving data is read. When SIOCR1<SIOINH> is set, the receiving is immediately ended and SIOSR<SIOF> is cleared to “0”. (The received data is ignored, and it is not required to be read out.)

If it is necessary to change the number of words in external clock operation, SIOCR1<SIOS> should be cleared to “0” then SIOCR2<BUF> must be rewritten after confirming that SIOSR<SIOF> has been cleared to “0”.

If it is necessary to change the number of words in internal clock, during automatic-wait operation which occurs after completion of data receiving, SIOCR2<BUF> must be rewritten before the received data is read out.

Note: The buffer contents are lost when the transfer mode is switched. If it should become necessary to switch the transfer mode, end receiving by clearing SIOCR1<SIOS> to “0”, read the last data and then switch the transfer mode.

Figure 2.10.9 Receive mode (example: 8-bit, 1 word, internal clock)

(3) 8-bit transmit/receive mode

After setting the control registers to the 8-bit transmit/receive mode, write the data to be transmitted first to the data buffer registers (DBR). After that, enable transceiving by setting <SIOS> to "1". When transmitting, the data are output from the SO pin at leading edges of the serial clock. When receiving, the data are input to the SI pin at the trailing edges of the serial clock. 8-bit data are transferred from the shift register to the data buffer register. An INTSIO interrupt is generated when the number of data words specified with the <BUF> has been transferred. The interrupt service program reads the received data from the data buffer register and then writes the data to be transmitted. The data buffer register is used for both transmitting and receiving; therefore, always write the data to be transmitted after reading the received data.

When the internal clock is used, a wait is initiated until the received data are read and the next data are written. A wait will not be initiated if even one data word has been written.

Note: The wait is also canceled by writing to a DBR not being used as a transmit data buffer registers; therefore, during SIO do not use such DBR for other applications.

When an external clock is used, the shift operation is synchronized with the external clock; therefore, it is necessary to read the received data and write the data to be transmitted next before starting the next shift operation. When an external clock is used, the transfer speed is determined by the maximum delay between generation of an interrupt request and the received data are read and the data to be transmitted next are written.

The transmit/receive operation is ended by clearing SIOCR1<SIOS> to "0" or setting SIOSR<SIOINH> to "1" in interrupt service program.

When SIOCR1<SIOINH> is set, the transmit/receive operation is immediately ended and SIOSR<SIOF> is cleared to "0".

If it is necessary to change the number of words in external clock operation, SIOCR1<SIOS> should be cleared to "0", then SIOCR2<BUF> must be rewritten after confirming that SIOSR<SIOF> has been cleared to "0".

If it is necessary to change the number of words in internal clock, during automatic-wait operation which occurs after completion of transmit/receive operation, SIOCR2<BUF> must be rewritten before reading and writing of the receive/transmit data.

Note: The buffer contents are lost when the transfer mode is switched. If it should become necessary to switch the transfer mode, end receiving by clearing SIOCR1<SIOS> to "0", read the last data and then switch the transfer mode.

Figure 2.10.11 Transmitted data hold time at end of transmit/receive

2.11 10-bit AD Converter (ADC)

The TMP86FM29 have a 10-bit successive approximation type AD converter.

2.11.1 Configuration

The circuit configuration of the 10-bit AD converter is shown in Figure 2.11.1.

It consists of control registers ADCCR1 and ADCCR2, registers ADCDR1 and ADCDR2, a DA converter, a sample-and-hold circuit, a comparator, and a successive comparison circuit.

Figure 2.11.1 AD converter (ADC)

2.11.2 Register Configuration

The AD converter consists of the following four registers:

- AD converter control register 1 (ADCCR1)
- AD converter control register 2 (ADCCR2)
- AD converted value register 1/2 (ADCDR1/ADCDR2)

(1) AD converter control register 1 (ADCCR1)

This register selects the analog channels and operation mode (software start or repeat) in which to perform AD conversion and controls the AD converter as it starts operating.

(2) AD converter control register 2 (ADCCR2)

This register selects the AD conversion time and controls the connection of the DA converter (ladder resistor network).

(3) AD converted value register (ADCDR1)

This register is used to store the digital value (Bit9 to bit2) after being converted by the AD converter.

(4) AD converted value register (ADCDR2)

This register is used to store the digital value (Bit1 and bit0) after being converted by the AD converter, and then this register is also used to monitor the operating status of the AD converter.

The AD converter control register configurations are shown in Figure 2.11.2 and Figure 2.11.3.

AINDS	Analog input control	0: Analog input enable 1: Analog input disable	
SAIN	Analog input channel select	0000: Selects AIN0 0001: Selects AIN1 0010: Selects AIN2 0011: Selects AIN3 0100: Selects AIN4 0101: Selects AIN5 0110: Selects AIN6 0111: Selects AIN7 1***: Reserved	

Note 1: Select analog input when AD converter stops (ADCCR2<ADBF> = "0").

Note 2: When the analog input is all use disabling, the AINDS should be set to "1".

Note 3: During conversion, do not perform output instruction to maintain a precision for all of the pins. And port near to analog input, do not input intense signaling of change.

Note 4: The ADRS is automatically cleared to "0" after starting conversion.

Note 5: Do not set ADRS newly again during AD conversion. Before setting ADRS newly again, check ADCCR<EOCF> to see that the conversion is completed or wait until the interrupt signal (INTADC) is generated (e.g., interrupt handling routine).

Note 6: After STOP or SLOW mode are started, AD converter control register 1 (ADCCR1) is all initialized. Therefore, set the ADCCR1 newly again after exiting these modes.

		110	1248/fc	78.0 μs	156.0 μs	—	—	
		111	Reserved					

Note 1: Settings for "–" in the above table are inhibited.

Note 2: Set conversion time by analog reference voltage (V_{AREF}) as follows.

$$V_{AREF} = 4.5 \text{ to } 5.5 \text{ V (15.6 } \mu \text{ or more)}$$

$$V_{AREF} = 2.7 \text{ to } 5.5 \text{ V (31.2 } \mu \text{ or more)}$$

$$V_{AREF} = 1.8 \text{ to } 5.5 \text{ V (124.8 } \mu \text{ or more)}$$

Note 3: Always set bit 0 in ADCCR2 to "0" and set bit 4 in ADCCR2 to "1".

Note 4: When a read instruction for ADCCR2, bit 6 to 7 in ADCCR2 read in as undefined data.

Note 5: fc; High-frequency clock [Hz]

Note 6: After STOP or SLOW mode are started, AD converter control register 2 (ADCCR2) is all initialized. Therefore, set the ADCCR2 newly again after exiting these modes.

Figure 2.11.2 AD converter control register

Figure 2.11.3 AD converter result register

2.11.3 AD Converter Operation

- (1) Set up the AD converter control register 1 (ADCCR1) as follows:
 - Choose the channel to AD convert using AD input channel select (SAIN).
 - Specify analog input enable for analog input control (AINDS).
 - Specify AMD for the AD converter control operation mode (software or repeat mode).
- (2) Set up the AD converter control register 2 (ADCCR2) as follows:
 - Set the AD conversion time using AD conversion time (ACK). For details on how to set the conversion time, refer to Note 2 for AD converter control register 2.
 - Choose IREFON for DA converter control.
- (3) After setting up (1) and (2) above, set AD conversion start (ADRS) of AD converter control register 1 (ADCCR1) to "1".
- (4) After an elapse of the specified AD conversion time, the AD converted value is stored in AD conversion result register 1 (ADCDR1), AD conversion result register (ADCDR2) and then the AD conversion end flag (EOCF) of AD conversion result register 2 (ADCDR2) is set to "1", upon which time AD conversion interrupt INTADC is generated.
- (5) EOCF is cleared to "0" by a read of the conversion result. However, if reconverted before a register read, although EOCF is cleared the previous conversion result is retained until the next conversion is completed.

2.11.4 AD Converter Operation Modes

There are following two AD converter operation modes:

- Software start: AD conversion is performed once by setting AMD to “01B” and ADRS to “1”.
- Repeat mode: AD conversion is performed repeatedly by setting AMD to “11B” and ADRS to “1”.

(1) Software start mode

After setting ADCCR1<AMD> to “01” (Software start mode), set ADCCR1<ADRS> to “1”. AD conversion of the voltage at the analog input pin specified by ADCCR1<SAIN> is thereby started.

After completion of the AD conversion, the conversion result is stored in AD conversion result registers (ADCDR1, ADCDR2) and at the same time ADCDR2<EOCF> is set to “1”, the AD conversion finished interrupt (INTADC) is generated.

ADCCR1<ADRS> is automatically cleared to “0” after AD conversion has started. Do not set ADCCR1<ADRS> newly again (Restart) during AD conversion. Before setting ADCCR1<ADRS> newly again, check ADCDR2<EOCF> to see that the conversion is completed or wait until the interrupt signal (INTADC) is generated (e.g., interrupt handling routine).

Figure 2.11.4 Operation in software start mode

Example: After selecting the conversion time of 19.5 μ s at 16 MHz and the analog input channel AIN3 pin, perform AD conversion once. After checking EOCF, read the converted value, store the lower 2 bits in address 009EH and store the upper 8 bits in address 009FH on RAM. The operation mode is software start mode.

; RESULT DATA READ
LD      A, (ADCDR2)
LD      (9EH), A
LD      A, (ADCDR1)
LD      (9FH), A

```

(2) Repeat mode

AD conversion of the voltage at the analog input pin specified by ADCCR1<SAIN> is performed repeatedly. In this mode, AD conversion is started by setting ADCCR1<ADRS> to "1" after setting ADCCR1<AMD> to "11".

After completion of the AD conversion, the conversion result is stored in AD conversion result registers (ADCDR1, ADCDR2) and at the same time ADCDR2<EOCF> is set to "1", the AD conversion finished interrupt (INTADC) is generated.

In repeat mode, each time one AD conversion is completed, the next AD conversion is started. To stop AD conversion, set ADCCR1<AMD> to "00B" (Disable mode). The AD convert operation is stopped immediately. The converted value at this time is not stored in the AD conversion result register.

Figure 2.11.5 Operation in repeat mode

2.11.5 STOP and SLOW Modes during AD Conversion

When the STOP or SLOW mode is entered forcibly during AD conversion, the AD convert operation is suspended and the AD converter is initialized (ADCCR1 and ADCCR2 are initialized to initial value). Also, the conversion result is indeterminate. (Conversion results up to the previous operation are cleared, so be sure to read the conversion results before entering STOP or SLOW mode.) When released from STOP or SLOW mode, AD conversion is not automatically restarted. Therefore, when the AD converter is used again, it is necessary to restart AD conversion (Set ADCCR1<ADRS> to "1"). Note that since the analog reference voltage is automatically disconnected, there is no possibility of current flowing into the analog reference voltage.

2.11.6 Analog Input Voltage and AD Conversion Result

The analog input voltage is corresponded to the 10-bit digital value converted by the AD as shown in Figure 2.11.6.

Figure 2.11.6 Analog input voltage and AD conversion result (typ.)

2.11.7 Precautions about AD Converter

(1) Analog input pin voltage range

Make sure the analog input pins (AIN0 to AIN7) are used at voltages within VSS below VAREF. If any voltage outside this range is applied to one of the analog input pins, the converted value on that pin becomes uncertain. The other analog input pins also are affected by that.

(2) Analog input shared pins

The analog input pins (AIN0 to AIN7) are shared with input/output ports. When using any of the analog inputs to execute AD conversion, do not execute input/output instructions for all other ports. This is necessary to prevent the accuracy of AD conversion from degrading. Not only these analog input shared pins, some other pins may also be affected by noise arising from input/output to and from adjacent pins.

(3) Noise countermeasure

The internal equivalent circuit of the analog input pins is shown in Figure 2.11.7. The higher the output impedance of the analog input source, more easily they are susceptible to noise. Therefore, make sure the output impedance of the signal source in your design is 5 k Ω or less. Toshiba also recommends attaching a capacitor external to the chip.

Figure 2.11.7 Analog input equivalent circuit and example of input pin processing

2.12 Key-On Wake-Up (KWU)

In the TMP86FM29, the STOP mode must be released by not only P20 ($\overline{\text{INT5}} / \overline{\text{STOP}}$) pin but also P64 to P67 pins.

When the STOP mode is released by P64 to P67 pins, the P20 ($\overline{\text{INT5}} / \overline{\text{STOP}}$) pin needs to be used.

2.12.1 Configuration

Figure 2.12.1 Key-on wake up circuit

Note: $\overline{\text{STOP}}$ pin doesn't have the control register such as STOPPCR, so when STOP mode is released by STOPx (x; 2 to 5), $\overline{\text{STOP}}$ pin should be used as STOP function.

2.12.2 Control

P64 to P67 (STOP2 to STOP5) pin can controlled by Key-On Wake-Up control register (STOPCR). It can be configured as enable/disable in one-bit unit. When those pins are used by STOP mode release, those pins must be set input mode (P6CR, P6DR, ADCCR1).

STOP mode can be entered by setting up the System Control Register1 (SYSCR1), and can be exited by detecting the falling edge on STOP2 to 5 pins, which are enabled by STOPCR, for releasing STOP mode (Note 1). Also, because each level of the STOP2 to 5 can be confirmed by reading P6DR, check all STOP2 to 5 pins that is enabled by STOPCR before the STOP mode is started (Note 2).

Note 1: When the STOP mode release by edge mode (SYSCR1<RELM> = "0"), prohibit input from STOP2 to STOP5 or must be set "1" level into STOP2 to STOP5 pins.

Note 2: When the $\overline{\text{STOP}}$ pin input is high or STOP2 to STOP5 pin input which is enabled by STOPCR is low, executing an instruction which starts STOP mode will not place in STOP mode but instead will immediately start the release sequence (warm-up).

Table 2.12.1 Input Edge (Level) of Stop Mode Release

Terminal name	As both terminal	SYSCR1<RELM> = "1"	SYSCR1<RELM> = "0"
		Release edge (Level)

Figure 2.12.2 Key-on wake-up control register

2.13 LCD Driver

The TMP86FM29 has a driver and control circuit to directly drive the liquid crystal device (LCD). The pins to be connected to LCD are as follows:

- | | |
|---|-------------------------|
| a. Segment output port | 8 pins (SEG7 to SEG0) |
| b. Segment output or P1, P5, P7 input/output port | 24 pins (SEG31 to SEG8) |
| c. Common output port | 4 pins (COM3 to COM0) |

In addition, C0, C1, V1, V2, V3 pin are provided for the LCD driver's booster circuit.

The devices that can be directly driven is selectable from LCD of the following drive methods:

- | | |
|----------------------------|---|
| a. 1/4 Duty (1/3 Bias) LCD | Max 128 Segments (8 segments × 16 digits) |
| b. 1/3 Duty (1/3 Bias) LCD | Max 96 Segments (8 segments × 12 digits) |
| c. 1/2 Duty (1/2 Bias) LCD | Max 64 Segments (8 segments × 8 digits) |
| d. Static LCD | Max 32 Segments (8 segments × 4 digits) |

2.13.1 Configuration

Figure 2.13.1 LDC driver

2.13.2 Control

The LCD driver is controlled using the LCD control register (LCDCR). The LCD driver's display is enabled using the EDSP.

LCDCR (0028 _H)	7	6	5	4	3	2	1	0	
	EDSP	BRES	VFSEL	DUTY	SLF				(Initial value: 0000 0000)

			DV7CK=0	DV7CK=1	SLEEP1/2 modes
		00	$fc/2^{17}$	$fs/2^9$	$fs/2^9$
		01	$fc/2^{16}$	$fs/2^8$	$fs/2^8$
		10	$fc/2^{15}$	$fc/2^{15}$	-
		11	$fc/2^{13}$	$fc/2^{13}$	-
DUTY	Selection of driving methods	00: 1/4 Duty (1/3 Bias) 01: 1/3 Duty (1/3 Bias) 10: 1/2 Duty (1/2 Bias) 11: Static			
VFSEL	Selection of boost frequency [Hz]		NORMAL1/2, IDLE1/2 modes		SLOW1/2
			DV7CK=0	DV7CK=1	SLEEP1/2 modes
		00	$fc/2^{13}$	$fs/2^5$	$fs/2^5$
		01	$fc/2^{11}$	$fs/2^3$	$fs/2^3$
		10	$fc/2^{10}$	$fs/2^2$	$fs/2^2$
		11	$fc/2^9$	$fc/2^9$	-
BRES	Booster circuit control	0: Disable (use divider resistance) 1: Enable			
EDSP	LCD Display Control	0: Blanking 1: Enables LCD display (Blanking is released)			

Note1: When <BRES>(Booster circuit control) is set to "0", $V_{DD} \geq V_3 \geq V_2 \geq V_1 \geq V_{SS}$ should be satisfied.
 When <BRES> is set to "1", $5.5[V] \geq V_3 \geq V_{DD}$ should be satisfied.
 If these conditions are not satisfied, it not only affects the quality of LCD display but also may damage the device due to over voltage of the port.

Note2: - ; Do not set the value.

Figure 2.13.2 LCD driver control register

(1) LCD driving methods

As for LCD driving method, 4 types can be selected by LCDCR<DUTY>. The driving method is initialized in the initial program according to the LCD used.

Figure 2.13.3 LCD drive waveform (COM-SEG pins)

(2) Frame frequency

Frame frequency (f_F) is set according to driving method and base frequency as shown in the following Table 2.13.1. The base frequency is selected by LCDCR<SLF> according to the frequency f_c and f_s of the basic clock to be used.

Table 2.13.1 Setting of LCD frame frequency

a. At the single clock mode. At the dual clock mode ($DV7CK = 0$).

SLF	Base frequency [Hz]	Frame frequency [Hz]			
		1/4 Duty	1/3 Duty	1/2 Duty	Static
00	$\frac{f_c}{2^{17}}$	$\frac{f_c}{2^{17}}$	$\frac{4}{3} \cdot \frac{f_c}{2^{17}}$	$\frac{4}{2} \cdot \frac{f_c}{2^{17}}$	$\frac{f_c}{2^{17}}$
	($f_c = 16$ MHz)	122	163	244	122
	($f_c = 8$ MHz)	61	81	122	61
01	$\frac{f_c}{2^{16}}$	$\frac{f_c}{2^{16}}$	$\frac{4}{3} \cdot \frac{f_c}{2^{16}}$	$\frac{4}{2} \cdot \frac{f_c}{2^{16}}$	$\frac{f_c}{2^{16}}$
	($f_c = 8$ MHz)	122	163	244	122
	($f_c = 4$ MHz)	61	81	122	61
10	$\frac{f_c}{2^{15}}$	$\frac{f_c}{2^{15}}$	$\frac{4}{3} \cdot \frac{f_c}{2^{15}}$	$\frac{4}{2} \cdot \frac{f_c}{2^{15}}$	$\frac{f_c}{2^{15}}$
	($f_c = 4$ MHz)	122	163	244	122
	($f_c = 2$ MHz)	61	81	122	61
11	$\frac{f_c}{2^{13}}$	$\frac{f_c}{2^{13}}$	$\frac{4}{3} \cdot \frac{f_c}{2^{13}}$	$\frac{4}{2} \cdot \frac{f_c}{2^{13}}$	$\frac{f_c}{2^{13}}$
	($f_c = 1$ MHz)	122	163	244	122

Note: f_c ; High-frequency clock [Hz]

b. At the dual clock mode ($DV7CK = 1$ or $SYSCK = 1$)

SLF	Base frequency [Hz]	Frame frequency [Hz]			
		1/4 Duty	1/3 Duty	1/2 Duty	Static
00	$\frac{f_s}{2^9}$	$\frac{f_s}{2^9}$	$\frac{4}{3} \cdot \frac{f_s}{2^9}$	$\frac{4}{2} \cdot \frac{f_s}{2^9}$	$\frac{f_s}{2^9}$
	($f_s = 32.768$ kHz)	64	85	128	64
01	$\frac{f_s}{2^8}$	$\frac{f_s}{2^8}$	$\frac{4}{3} \cdot \frac{f_s}{2^8}$	$\frac{4}{2} \cdot \frac{f_s}{2^8}$	$\frac{f_s}{2^8}$
	($f_s = 32.768$ kHz)	128	171	256	128

Note: f_s ; Low-frequency clock [Hz]

(3) Booster circuit for LCD driver

The LCD voltage booster pin can select the booster circuit or the divider resistance.

The booster circuit control is selected by LCDCR<BRES>.

The booster circuit boosts the output voltage for the segment/common signal by double (V2) and triple (V3) in relation to the on-chip output voltage (1 V typ.).

When used as the divider resistance, the V1, V2 and V3 pins are input by divider voltage of external supply.

When used as the booster circuit, the VLCD setting should be composed to 1/3 bias.

The selection of boost frequency is selected by LCDCR<VFSEL>.

Selecting the fast frequency using the SLFR in the command register (LCDCR) raises the drive capability of segment/common.

Table 2.13.2 shows the V3 pin current capacity and Boosting Frequency.

Figure 2.13.4 Example of a booster circuit (LCDCR<BRES> = "1")

Figure 2.13.5 Example of divider resistance (LCD<CR>BRES = "0")

Table 2.13.2 V3 pin current capacity and boosting frequency (typ.)

VFSEL	Boosting frequency	$f_c = 16 \text{ MHz}$	$f_c = 8 \text{ MHz}$	$f_c = 4 \text{ MHz}$	$f_s = 32.768 \text{ kHz}$
00	$f_c/2^{13}$ or $f_s/2^5$	$-37 \text{ mV} / \mu\text{A}$	$-80 \text{ mV} / \mu\text{A}$	$-138 \text{ mV} / \mu\text{A}$	$-76 \text{ mV} / \mu\text{A}$
01	$f_c/2^{11}$ or $f_s/2^3$	$-19 \text{ mV} / \mu\text{A}$	$-24 \text{ mV} / \mu\text{A}$	$-37 \text{ mV} / \mu\text{A}$	$-23 \text{ mV} / \mu\text{A}$
10	$f_c/2^{10}$ or $f_s/2^2$	$-17 \text{ mV} / \mu\text{A}$	$-19 \text{ mV} / \mu\text{A}$	$-24 \text{ mV} / \mu\text{A}$	$-18 \text{ mV} / \mu\text{A}$
11	$f_c/2^9$	$-16 \text{ mV} / \mu\text{A}$	$-17 \text{ mV} / \mu\text{A}$	$-19 \text{ mV} / \mu\text{A}$	–

Note 1: The current capacity is the amount of voltage that falls per $1 \mu\text{A}$.

Note 2: The boosting frequency should be selected depending on your LCD panel.

Note 3: For the reference pin V1, a current capacity ten times larger than the above is recommended to ensure stable operation.

Not Recommended for New Design

2.13.3 LCD Display Operation

(1) Display data setting

Display data is stored to the display data area (assigned to address 0F80 to 0F8FH) in the DBR. The display data which are stored in the display data area is automatically read out and sent to the LCD driver by the hardware. The LCD driver generates the segment signal and common signal according to the display data and driving method. Therefore, display patterns can be changed by only over writing the contents of display data area by the program. Figure 2.13.6 shows the correspondence between the display data area and SEG/COM pins.

LCD light when display data is “1” and turn off when “0”. According to the driving method of LCD, the number of pixels which can be driven becomes different, and the number of bits in the display data area which is used to store display data also becomes different.

Therefore, the bits which are not used to store display data as well as the data buffer which corresponds to the addresses not connected to LCD can be used to store general user process data (see Table 2.13.3).

Note: The display data memory contents become unstable when the power supply is turned on; therefore, the display data memory should be initialized by an initiation routine.

Address	bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
0F80H		SEG1					SEG0	
81		SEG3					SEG2	
82		SEG5					SEG4

Driving methods	bit 7/3	bit 6/2	bit 5/1	bit 4/0
1/4 Duty	COM3	COM2	COM1	COM0
1/3 Duty	—	COM2	COM1	COM0
1/2 Duty	—	—	COM1	COM0
Static	—	—	—	COM0

Note: —; This bit is not used for display data

(2) Blanking

Blanking is enabled when EDSP is cleared to “0”.

Blanking turns off LCD through outputting a GND level to SEG/COM pin.

When in STOP mode, EDSP is cleared to “0” and automatically blanked. To redisplay LCD after exiting STOP mode, it is necessary to set EDSP back to “1”.

Note: During reset, the LCD segment outputs (SEG0 to SEG7) and LCD common outputs are fixed “0” level. But the multiplex terminal (P1, P5 and P7 ports) of input/output port and LCD segment output becomes high impedance. Therefore, when the reset input is long remarkably, ghost problem may appear in LCD display.

2.13.4 Control Method of LCD Driver

(1) Initial setting

Figure 2.13.7 shows the flowchart of initialization.

Example: To operate a 1/4 duty LCD of 32 segments $\times$ 4 commons at frame frequency $f_c/2^{16}$ [Hz] and boost frequency $f_c/2^{13}$ [Hz].

```

LD    (LCDCR),11000001B    ; Display enable
```

Figure 2.13.7 Initial setting of LCD driver

(2) Store of display data

Generally, display data are prepared as fixed data in program memory and stored in display data area by load command.

Example 1: To display using 1/4 duty LCD a numerical value which corresponds to the LCD data stored in data memory at address 80H (when pins COM and SEG are connected to LCD as in Figure 2.13.8), display data become as shown in Table 2.12.2.

2.14 FLASH Memory

2.14.1 Outline

The TMP86FM29 incorporates 32768 bytes of FLASH memory (Address 8000H to FFFFH). The writing to FLASH memory is controlled by FLASH control register (EEPCR) and FLASH status register (EEPSR).

To write data to the FLASH, execute the Serial PROM mode. For details about the Serial PROM mode, refer to “2.1 Serial PROM mode”.

The FLASH memory of the TMP86FM29 features:

- The FLASH memory is constructed of 512 pages FLASH memory and one page size is 64 bytes (512 pages × 64 bytes = 32768 bytes).
- The TMP86FM29 incorporates a 64-byte temporary data buffer. The data written to FLASH memory is temporarily stored in this data buffer. After 64 bytes data have been written to the temporary data buffer, the writing to FLASH memory automatically starts by page writing (The 64 bytes data are written to specified page of FLASH simultaneously). At the same time, page-by-page erasing occurs automatically. So, it is unnecessary to erase individual pages in advance.
- The FLASH control circuit incorporates an oscillator dedicated to the FLASH. So FLASH writing time is independent of the system clock frequency (fc). In addition, because an FLASH control circuit controls writing time for each FLASH memory cell, the writing time varies in each page (Typically 4 ms per page).
- Controlling the power for the FLASH control circuit (regulator and voltage step-up circuit) achieves low power consumption if the FLASH is not in use (Example: When the program is executed in RAM area).

2.14.2 Conditions for Accessing the FLASH Areas

The conditions for accessing the FLASH areas vary depending on each operation mode. The following tables shows FLASH are access conditions.

Table 2.14.1 FLASH Area Access Conditions

	Area	Operation Mode	
		MCU mode (Note 1)	Serial PROM mode (Note 2)
Flash Memory	8000H to FFFFH	Read/fetch only	Write/read/fetch supported

Note 1: “MCU mode” shows NORMAL1/2 and SLOW1/2 modes.

Note 2: “Serial PROM mode” shows the FLASH controlling mode. For details, refer to “2.1 Serial PROM mode”.

Note 3: “Fetch” means reading operation of FLASH data as an instruction by CPU.

2.14.3 Differences among Product Series

The specifications of the FLASH product (TMP86FM29) are different from those of the emulation chip (TMP86C929A) and the MASK/OTP products (TMP86C829B/CH29B/CM29B/PM29A) as listed below. See 2.15.2 "Control" for explanations about the control registers.

		FLASH Product (TMP86FM29)	Emulation Chip MASK/OTP Product
Rewriting the EEPCR register<EEPMD, EEPRS, MNPWDW>		It is possible to rewrite the EEPCR register only when the program execution area in use is RAM/BOOT-ROM.	The FLASH function is not executed because the emulation chip and the MASK/OTP products don't have EEPCR and EEPSR registers.
FLASH write time (The emulation chip is written to emulation memory instead of FLASH)		Typically 4 ms (Independent of the system clock)	Therefore, the software including the FLASH register can not be emulated by the emulation chip.
Executing a read instruction/fetch to the 8000H to FFFFH area when EEPSR<BFBUSY> = "1"		If EEPSR<BFBUSY> = "1", executing a read instruction/fetch to the FLASH area causes FFH to be read regardless of what the current ROM data is. Fetching FFH results in a software interrupt occurring.	And then if the software including the FLASH register is executed in the MASK or the emulation chip, the software process differs from the FLASH product.
Executing a write instruction to the 8000H to FFFFH area when EEPCR<EEPMD> = "0011", EEPSR<EWUPEN> = "1" and EEPSR<BFBUSY> = "0".	MCU mode	The EEPSR<BFBUSY> stays at "0" (Write disabled).	
	Serial PROM mode	The EEPSR<BFBUSY> is set to "1" (write enabled).	
CPU wait for Flash (Wait period for stabilizing of the power supply of Flash control circuit)		The wait period is inserted in the releasing from Reset, STOP mode (EEPCR<MNPWDW>="1") and IDLE/SLEEP mode (EEPCR<ATPWDW>="0"). Even if the FLASH register is not used for software, the wait period is inserted in Reset process.	The wait period is not inserted. Even if the FLASH register is not used for software, the Reset and STOP process differs from the FLASH product.
BOOT-ROM		2 Kbytes are included in the 3800H to 3FFFH area.	The emulation chip and MASK/OTP products don't have the BOOT-ROM.
Operating voltage		VDD = 1.8 to 3.6 V	VDD = 1.8 to 5.5 V (MASK) VDD = 1.8 to 5.25 V (Emulation chip)

64 consecutive bytes in the FLASH area are treated as one group, which is defined as a page. The TMP86FM29 incorporates a one-page temporary data buffer. Writing data to FLASH is temporarily stored in this 64-byte data buffer. After 64 bytes data have been written to the temporary data buffer, these data are written to specified page of FLASH at a time. However, data can be read from any address byte by byte.

The FLASH area has a page configuration of 64 bytes/page as shown below. The total number of bytes in it is 512 pages $\times$ 64 bytes (= 32768 bytes). The writeable area is 8000H to FFFFH in Serial PROM mode.

Note: The FLASH memory (8000H to FFFFH) can be written only in the Serial PROM mode. For details of the Serial PROM mode, refer to “2.1 Serial PROM mode”.

Figure 2.14.1 Page Configuration

2.15 FLASH Memory Control Circuit

2.15.1 Configuration

Figure 2.15.1 FLASH Memory Control

2.15.2 Control

The FLASH is controlled by FLASH control register (EEPCR) and FLASH status register (EEPSR).

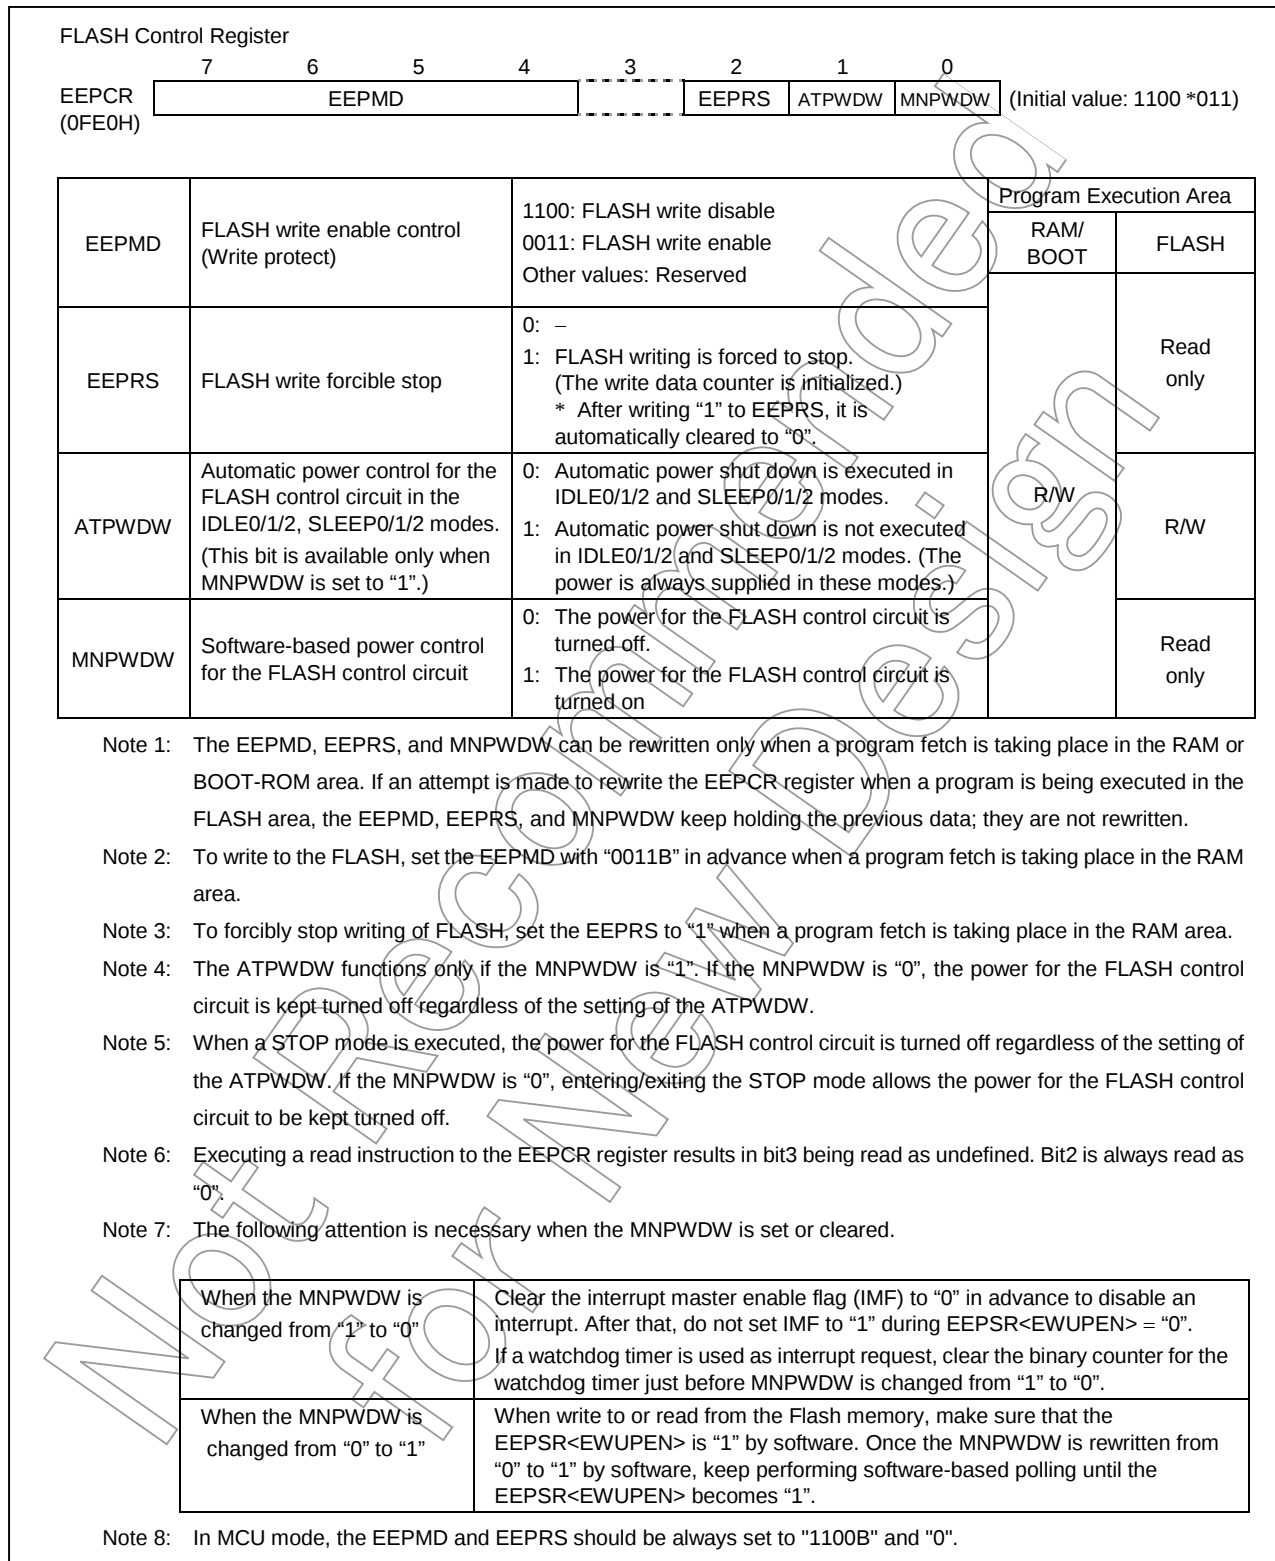

Figure 2.15.2 FLASH Control Register

FLASH status register

WINT	Interrupt detection during a write to the FLASH		0: Not detected 1: Detected (Interrupt occurred) * WINT is automatically cleared to "0" when read instruction is executed to EEPSR.			Read only
EWUPEN	FLASH control circuit status monitor	Control circuit status	Operating (power on)		Halt (power off) or warm-up	
		FLASH status	Temporary data buffer empty	Writing	Disable	
			1	1	0	
BFBUSY	FLASH write busy flag		0	1	1	

Note 1: If a nonmaskable interrupt occurs during a write to the FLASH, the WINT is set to "1" and the writing is discontinued, and then warm-up (CPU wait) for the control circuit of Flash memory is executed. (The write data counter is initialized.) If WINT = "1" is detected in the nonmaskable interrupt service routine, a write is not completed successfully. So, it is necessary to try a write again. The content of the page to which a write is taking place may be changed to an unexpected value depending on the timing when the WINT becomes "1".

Note 2: Even if a nonmaskable interrupt occurs during an FLASH warm-up, the CPU stays at a halt until the warm-up is finished.

Note 3: The WINT is automatically cleared to "0" when a read instruction is executed to the EEPSR register.

Note 4: When MNPWDW is changed from "0" to "1", EWUPEN becomes "1" after taking $2^{10}/f_c$ [s] (if SYSCK = "0") or $2^3/f_s$ [s] (if SYSCK = "1"). Before accessing the FLASH, make sure that the EWUPEN is "1" in the RAM area.

Note 5: If the BFBUSY is "1", executing a read instruction or fetch to the FLASH area causes FFH to be read. Fetching FFH results in a software interrupt occurring.

Figure 2.15.3 FLASH Status Register

2.15.3 FLASH Write Enable Control (EEPCR<EEPMD>)

In the FLASH product, the control register can be used to disable a write to the FLASH (Write protect) in order to prevent a write to the FLASH from occurring by mistake because of a program error or microcontroller malfunction. To enable a write to the FLASH, set the EEPCR<EEPMD> with 0011B. To disable a write to the FLASH, set the EEPCR<EEPMD> with 1100B. A reset initializes the EEPCR<EEPMD> to 1100B to disable a write to the FLASH. Usually, set the EEPCR<EEPMD> with 1100B, except when it is necessary to write to the FLASH.

Note1: The FLASH memory (8000H to FFFFH) can be written only in the Serial PROM mode.

Note2: The EEPCR<EEPMD> can be rewritten only when a program is being executed in the RAM area. Executing a write instruction to the EEPCR<EEPMD> in the FLASH area does not change its setting.

Note3: This function can be used in Serial PROM mode. In MCU mode, the EEPCR<EEPMD> should be always set to "1100B".

Not Recommended
for New Design

2.15.4 FLASH Write Forcible Stop (EEPCR<EEPRS>)

To forcibly stop a write to the FLASH, set the EEPCR<EEPRS> to "1". Setting the EEPCR<EEPRS> to "1" initializes the write data counter of data buffer and forcibly stops a write, and then a warm-up (CPU wait) for the control circuit of Flash memory is executed. After warm-up period, the EEPSR<BFBUSY> is cleared to "0". The warm-up period is $2^{10}/f_c$ (SYSCK = "0") or $2^3/f_s$ (SYSCK = "1"). After this, if writing to FLASH starts again, data is stored as the first byte of the temporary data buffer and sets the EEPSR<BFBUSY> to "1". Therefore, it is necessary to write 64 bytes data to the temporary data buffer.

After 1 to 63 bytes are saved to the temporary data buffer, if the EEPCR<EEPRS> is set to "1" the specified page of FLASH is not written. (It keeps previous data.)

Note 1: After 64 bytes are written to the temporary data buffer, the setting the EEPCR<EEPRS> to "1" may cause the writing the page of FLASH to an unexpected value.

Note 2: The EEPCR<EEPRS> can be rewritten only when a program is being executed in the RAM area. In the FLASH area, executing a write instruction to the EEPCR<EEPRS> does not affect its setting.

Note 3: During the warm-up period for Flash memory (CPU wait), the peripheral circuits continue operating, but the CPU stays at a halt until the warm-up is finished. Even if an interrupt latch is set to "1" by generating of interrupt request, an interrupt sequence doesn't start till the end of warm-up. If interrupts occur during a warm-up period with IMF = "1", the interrupt sequence which depends on interrupt priority will start after warm-up period.

Note 4: When the EEPCR<EEPRS> is set to "1" with EEPSR<BFBUSY> = "0", a warm-up is not executed.

Note 5: If executed a write or read instruction to the Flash area immediately after setting EEPCR<EEPRS>, insert one or more machine cycle instructions after setting EEPCR<EEPRS>.

Example: Reads the Flash memory data immediately after setting EEPCR<EEPRS> to "1"

LD	HL,8000H	
LD	(EEPCR),3FH	; Set EEPCR<EEPRS> to "1"
NOP		; NOP
		(Do not execute write or read instruction immediately after setting EEPCR<EEPRS>.)
LD	A,(HL)	; Reads the data of address 8000H
		(Write or read instruction to the Flash memory)

Note 6: This function can be used in Serial PROM mode. In MCU mode, the EEPCR<EEPRS> should be always set to "0".

Figure 2.15.4 Write Data Counter Initialization and Write Forcible Stop

2.15.5 Power Control for the FLASH Control Circuit

For the FLASH product, it is possible to turn off the power for FLASH control circuit (such as a regulator) to suppress power consumption if the FLASH area is not accessed.

The EEPCCR<MNPWDW> and EEPCCR<ATPWDW> are used to control the power for the FLASH control circuit. If the power for the FLASH control circuit is turned off according to the setting of these registers, starting to use the circuits again needs to allow warm-up time for the power supply.

Table 2.15.1 Power Supply Warm-up Time (CPU wait) for the FLASH Control Circuit

NORMAL1/2 IDLE0/1/2 Mode	SLOW1/2 SLEEP0/1/2 Mode	STOP Mode (when EEPCCR<MNPWDW> = "1")	
		To Return to a NORMAL Mode	To Return to a SLOW Mode
$2^{10}/f_c$ [s] (64 μ s @16 MHz)	$2^3/f_s$ [s] (244 μ s @32.768 kHz)	STOP warm-up time + $2^{10}/f_c$ [s]	STOP warm-up time + $2^3/f_s$ [s]

2.15.5.1 Software-based Power Control for the FLASH Control Circuit (EEPCCR<MNPWDW>)

The EEPCCR<MNPWDW> is a software-based power control bit for the FLASH control circuit. When a program is being executed in the RAM area, setting this bit enables software-based power control. Clearing the EEPCCR<MNPWDW> to "0" immediately turns off the power for the FLASH control circuit. Once the EEPCCR<MNPWDW> is switched from "0" to "1", before attempting a read or fetch from the FLASH area, it is necessary to insert a warm up period by software until the power supply is stabilized. In this case, because the CPU wait is not executed, any other instructions except accessing to Flash (write or read) are available. When MNPWDW is changed from "0" to "1", EWUPEN becomes "1" after taking $2^{10}/f_c$ [s] (SYSCK = "0") or $2^3/f_s$ [s] (SYSCK = "1"). Usually software-based polling should be performed until the EEPSCR<EWUPEN> becomes "1". An example of setting is given below.

(1) Example of controlling the EEPCCR<MNPWDW>

1. Transfer a program for controlling the EEPCCR<MNPWDW> to the RAM area.
2. Release an address trap in the RAM area (Setup the WDTCR1 and WDTCR2 registers).
3. Jump to the control program transferred to the RAM area.
4. Clear the interrupt master enable flag (IMF $\leftarrow$ "0").
5. Clear the binary counter if the watchdog timer is in use.
6. To turn off the power for the FLASH control circuit, clear the EEPCCR<MNPWDW> to "0".
7. Perform CPU processing as required.
8. To access the FLASH area again, set the EEPCCR<MNPWDW> to "1".
9. Keep program polling until the EEPSCR<EWUPEN> becomes "1".
(Upon completion of an FLASH warming-up, the EEPSCR<EWUPEN> is set to "1". It takes $2^{10}/f_c$ (SYSCK = "0") or $2^3/f_s$ (SYSCK = "1") until EWUPEN becomes "1".)

This procedure enables the FLASH area to be accessed.

If the EEPCR<MNPWDW> is “1”, entering a STOP mode forcibly turns off the power for the FLASH control circuit. When the STOP mode is released, a STOP mode oscillation warm-up is carried out, and then the CPU wait period (Warm-up for stabilizing of FLASH power supply circuit) is automatically performed. If the EEPCR<MNPWDW> is “0”, entering/exiting the STOP mode keeps the power for the FLASH control circuit turned off.

Note 1: If the EEPSR<EWUPEN> is “0”, do not access (Fetch, read, or write) the FLASH area. Executing a read instruction or fetch to the FLASH area causes FFH to be read. Fetching FFH results in a software interrupt occurring.

Note 2: To clear the EEPCR<MNPWDW> to “0”, clear the interrupt master enable flag (IMF) to “0” in advance to disable an interrupt. After that, do not set IMF to “1” during EEPSR<EWUPEN> = “0”.

Note 3: If the EEPCR<MNPWDW> is “0”, generating a nonmaskable interrupt automatically rewrites the MNPWDW to “1” to warm up the FLASH control circuit (CPU wait). That time, the peripheral circuits continue operating, but the CPU stays at a halt until the warm-up is finished.

Note 4: The EEPCR<MNPWDW> can be rewritten only when a program is being executed in the RAM area. In the FLASH area, executing a write instruction to the EEPCR<MNPWDW> does not affect its setting.

Note 5: If a watchdog timer is used as interrupt request, clear the binary counter for the watchdog timer just before MNPWDW is changed from “1” to “0”.

Note 6: During the warm-up period with a software polling of EEPSR<EWUPEN>, if a nonmaskable interrupt occurs, the CPU stays at a halt until the warm-up is finished.

Figure 2.15.5 Software-based Power Control for the FLASH Control Circuit (EEPCR<MNPWDW>)

Example: Performing software-based power control for the FLASH control circuit

sRAMAREA:

```
          DI                      ; Disable an interrupt (IMF ← "0")
          LD      (WDTCR2),4Eh    ; Clear the binary counter if the watchdog
                                   timer is in use
          CLR      (EEPCR).0       ; Clear the EEPCR<MNPWDW> to "0".
          |
          SET      (EEPCR).0       ; Set the EEPCR<MNPWDW> to "1"
sLOOP1:  TEST      (EEPSR).1       ; Monitor the EEPSR<EWUPEN> register.
          JRS      T,sLOOP1        ; Jump to sLOOP1 if EEPSR<EWUPEN>
                                   = "0"
          JP       MAIN            ; Jump to the FLASH area.
```

Not Recommended
for New Design

2.15.5.2 Automatic Power Control for the FLASH Control Circuit (EEPCR<ATPWDW>)

The EEPCR<ATPWDW> is an automatic power control bit for the FLASH control circuit. It is possible to suppress power consumption by automatically shutting down the power for the FLASH control circuit when an operation mode is changed to IDLE0/1/2 and SLEEP0/1/2 modes. This bit can be specified regardless of the area in which a program is being executed.

After the EEPCR<ATPWDW> is cleared to "0", entering an operation mode (IDLE0/1/2 or SLEEP0/1/2) where the CPU is at a halt automatically turns off the power for the FLASH control circuit. Once the operation mode is released, the warm-up time (CPU wait) is automatically counted to resume normal processing. The CPU wait period is either $2^{10}/f_c$ (SYSCK = "0") or $2^3/f_s$ (SYSCK = "1"). If the EEPCR<ATPWDW> is "1", releasing the operation mode does not cause the CPU wait.

If EEPCR<MNPWDW> = "1", executing a STOP mode forcibly turns off the power for the FLASH control circuit regardless of the setting of the EEPCR<ATPWDW>. When the STOP mode is released, a STOP mode oscillation warm-up is carried out, and then an FLASH control circuit warm-up (CPU wait) is automatically performed. If the EEPCR<MNPWDW> is "0", entering/exiting a STOP mode allows the power for the FLASH control circuit to be kept turned off.

Note 1: The EEPCR<ATPWDW> functions only if the EEPCR<MNPWDW> is "1". If the EEPCR<MNPWDW> is "0", the power for the FLASH control circuit is kept turned off when an operation mode is executed or released.

Note 2: During an FLASH warm-up (CPU wait), the peripheral circuits continue operating, but the CPU stays at a halt. Even if an interrupt latch is set under this condition, no interrupt process occurs until the CPU wait is completed. If the IMF is "1" when the interrupt latch is set, interrupt process takes place according to the interrupt priority after the CPU has started operating.

Figure 2.15.6 Automatic Power Control for the FLASH Control Circuit (EEPCR<ATPWDW>)

2.15.6 Accessing the FLASH Memory Area

During the writing to the FLASH memory area, neither a read nor fetch can be performed for the 8000H to FFFFH area. Therefore, to write the FLASH area, the program should be executed in the BOOTROM or RAM area. Basically, to write the FLASH area, the program can be executed in BOOTROM area by using the FLASH writing mode of the Serial PROM mode, but it can be also executed any user program in RAM area by using the RAM loader mode of the Serial PROM mode.

Explanation here is made of only the method of FLASH programming in RAM area. For detail about each operation mode of the Serial PROM mode, refer to “2.1 Serial PROM Mode”.

Although the writing to FLASH is executed on page-by-page, the reading from FLASH is executed on byte-by-byte.

If a nonmaskable interrupt occurs during a write to the FLASH (EEPSR<BFBUSY> = “1”), the WINT is set to “1” and the writing is discontinued, and then the warm-up (CPU wait) for control circuit of Flash memory is executed (The write data counter is also initialized). If WINT = “1” is detected in the nonmaskable interrupt service routine, a write is not completed successfully. So, it is necessary to try a write again. The warm-up period is $2^{10}/f_c$ (SYSCK = “0”) or $2^3/f_s$ (SYSCK = “1”). After 1 to 63 bytes are saved to the temporary data buffer, if an interrupt generates, the specified page of FLASH is not written. (It keeps previous data.)

Note 1: Writing to the FLASH area is enabled only in Serial PROM mode. For details of Serial PROM mode, refer to “2.1 Serial PROM mode”.

Note 2: After 64 bytes are written to the temporary data buffer, the generating of an interrupt may cause the writing the page of FLASH to an unexpected value.

Note 3: During the warm-up period for Flash memory (CPU wait), the peripheral circuits continue operating, but the CPU stays at a halt until the warm-up is finished. Even if an interrupt latch is set to “1” by generating of interrupt request, an interrupt sequence doesn't start till the end of warm-up. If interrupts occur during a warm-up period with IMF = “1”, the interrupt sequence which depends on interrupt priority will start after warm-up period.

Note 4: When write the data to Flash memory from RAM area, disable all the nonmaskable interrupt by clearing interrupt master enable flag (IMF) to “0” beforehand.

2.15.6.1 FLASH Writing Program in the RAM Area

To develop the program in RAM, the write control program should be loaded from external device by using RAM loader mode in Serial PROM mode. Given below is an example of writing the control program in the RAM area.

(1) Example of writing program in the RAM area

1. Monitor the EEP SR<EWUPEN>. If it is "0", set the EEP CR<MNPWDW> to "1", and then start and keep polling until the EEP SR<EWUPEN> becomes "1".
2. Clear the interrupt master enable flag (IMF ← "0").
3. Set the EEP CR with "3BH" (to enable a write to the FLASH).
4. Execute a write instruction for 64 bytes to the FLASH area.
5. Start and keep polling by software until the EEP SR<BFBUSY> becomes "0". (Upon completion of an erase and write to the FLASH cells, the EEP SR<BFBUSY> is set to "1". For the FLASH product, the required write time is typically 4 ms.)
6. Set the EEP CR with "CBH" (to disable a write to the FLASH).

Note: See (2), "Method of specifying an address for a write to the FLASH," for a description about the FLASH address to be specified at step 4 above.

Not Recommended for New Design

(2) Method of specifying an address for a write to the FLASH

The FLASH page to be written is specified by the 10 high-order bits of the address of the first-byte data. The first-byte data is stored at the first address of the temporary data buffer. If the data to be written is, for example, 8040H, page 1 is selected, and the data is stored at the first address of the temporary data buffer. Even if the 6 low-order bits of the specified address is not 000000B, the first-byte data is always stored at the first address of the data buffer.

Any address can be specified as the second and subsequent address within FLASH area (8000H to FFFFH). The write data bytes are stored in the temporary data buffer in the sequence they are written, regardless of what address is specified. Usually, the address that is the same as the first-byte is specified for the second and subsequent address. A 16-bit transfer instruction (LDW) can also be used for writing to the temporary data buffer.

Example: Data bytes 00H to 3FH are written to page 1.
(Figure 2.15.7 shows the example of data buffer and pages.)

```

DI          ; Disable an interrupt (IMF ← "0")
LD          C,00H
LD          HL,EEPCR      ; Specify the EEPCR register address.
LD          IX,8040H      ; Specify a write address.
LD          (HL),3BH      ; Specify the EEPCR

sLOOP1:
LD          (IX),C        ; Store data to the temporary data buffer.
                        ; (A write page is selected when the first
                        ; byte is written.)

INC         C             ; C = C + 1
CMP         C,40H         ; Jump to sLOOP1 if C is not 40H
JR          NZ,sLOOP1

sLOOP2:
TEST        (EEPSR).0
JRS         F,sLOOP2      ; Jump to sLOOP2 if EEPSR<BFBUSY> =
                        ; "1".
LD          (HL),0CBH      ; Specify the EEPCR

```

Note: If the BFBUSY is "1", executing a read instruction or fetch to the FLASH area causes "FFH" to be read. Fetching "FFH" results in a software interrupt occurring.

Figure 2.15.8 Data Buffer and Write Page (Example)

Figure 2.15.9 Write to the FLASH Memory Area

2.16 Serial PROM Mode

2.16.1 Outline

The TMP86FM29 has a 2 Kbytes BOOT-ROM for programming to FLASH memory. This BOOT-ROM is a mask ROM that contains a program to write the FLASH memory on-board. The BOOT-ROM is available in a serial PROM mode and it is controlled by P11 pin, BOOT(P15) pin, TEST pin and $\overline{\text{RESET}}$ pin, and is communicated via TXD (P16) and RXD (P15) pins. There are four operation modes in a serial PROM mode: FLASH memory writing mode, RAM loader mode, FLASH memory SUM output mode and Product discrimination code output mode. Operating area of serial PROM mode differs from that of MCU mode. The operating area of serial PROM mode shows in Table 2.16.1.

Table 2.16.1 Operating Area of Serial PROM Mode

Parameter	Min	Max	Unit
Operating voltage	2.7	3.6	V
High frequency (Note)	2	16	MHz
Temperature	25 $\pm$ 5		°C

Note: Even though included in above operating area, part of frequency can not be supported in serial PROM mode. For details, refer to Table 2.16.6.

2.16.2 Memory Mapping

The BOOT-ROM is mapped in address 3800H to 3FFFH. The Figure 2.16.1 shows a memory mapping.

Figure 2.16.1 Memory Address Maps

2.16.3 Serial PROM Mode Setting

2.16.3.1 Serial PROM Mode Control Pins

To execute on-board programming, start the TMP86FM29 in serial PROM mode. Setting of a serial PROM mode is shown in Table 2.16.2.

Table 2.16.2 Serial PROM Mode Setting

Pin	Setting
BOOT/RXD pin (P15)	High
P11 pin	Low
$\overline{\text{RESET}}$, TESTpin	

2.16.3.2 Pin Function

In the serial PROM mode, TXD (P16) and RXD (P15) pins are used as a serial interface pin.

Table 2.16.3 Pin function in the Serial PROM Mode

Pin Name (Serial PROM Mode)	Input/ Output	Function		Pin Name (MCU Mode)
TXD	Output	Serial data output Connect the pull-up resistor.	(Note 1)	P16
RXD	Input	Serial data input		P15
$\overline{\text{RESET}}$	Input	Serial PROM mode control		$\overline{\text{RESET}}$
TEST	Input	Serial PROM mode control		TEST
P11	Input	Serial PROM mode control (Fix to "L" level)		P11
VDD, AVDD	Power Supply	2.7 V to 3.6 V		
VSS		0V		
VAREF		Open or equal with VDD		
P10, P12 to P14, P17 P20 to P22 P30 to P33 P50 to P57 P60 to P67 P70 to P77	I/O	Placed in High-Z state during serial PROM mode.		
SEG7 to SEG0 COM3 to COM0	Output	Placed to "L" level state during serial PROM mode.		
C0, C1, V3 to V1	LCD voltage booster pin	Connect the capacitor or open.		
XIN	Input	Resonator connecting pins for high-frequency clock.	(Note 2)	
XOUT	Output	For inputting external clock, XIN is used and XOUT is opened.		

Note 1: When the device is used as on-board writing and other parts are already mounted in place, be careful not to affect these communication control pins.

Note 2: Operating area of high frequency in serial PROM mode is from 2 MHz to 16 MHz.

To set a serial PROM mode, connect device pins as shown in Figure 2.16.2.

Figure 2.16.2 Serial PROM Mode Port Setting

2.16.3.3 Activating Serial PROM Mode

The following is a procedure of setting of serial PROM mode. Figure 2.16.3 shows a serial PROM mode timing.

- (1) Turn on the power to the VDD pin.
- (2) Set the P11 pin, TEST pin and $\overline{\text{RESET}}$ pin to low level.
- (3) Set the BOOT/RXD pin (P15) to high level.
- (4) Wait until the power supply and clock sufficiently stabilize.
- (5) Set the TEST pin from low level to high level.
- (6) Release the $\overline{\text{RESET}}$. (Set to high level)
- (7) Input a matching data (5AH) to RXD pin after waiting for setup sequence.

Figure 2.16.3 Serial PROM Mode Timing

Table 2.16.4 Serial PROM Mode Timing characteristics

Parameter		Symbol	The Number of Clock (fc)	Required Minimum Time	
				at fc = 2 MHz	at fc = 16 MHz
Setup time for TEST pin	$Rstf > 512 / fc [s]$	Tssup	-	1 ms	
	$Rstf < 512 / fc [s]$		-	0	*Note1
Initialization time for TEST pin		Tsint	-	1ms	
Time from reset release until acceptance of start bit of RXD pin		RXsup	110000	55 ms	6.9 ms

Note 1: If Rstf is shorter than $512 / fc[s]$ due to using CMOS-type reset IC or Logic IC, the TEST pin can input the same pulse as the $\overline{\text{RESET}}$ pin input. (TEST pin can be directly connected to the $\overline{\text{RESET}}$ pin.) However, drive the pins carefully not to affect the pin's input level, as the TEST pin and the $\overline{\text{RESET}}$ pin have pull-down resistor and pull-up resistor built-in.

Note 2: fc; High-frequency clock

2.16.3.4 Examples of On-board writing

Figure 2.16.4 shows examples of On-board writing.

Figure 2.16.4 Examples of Onboard writing

Note 1: If capacity for LCD panel and other devices on the application board affect UART communication in Serial PROM mode, disconnect these pins by using a jumper or a switch.

Note 2: Set the P11 pin to GND. There are two ways. Set P11 pin to GND on the external board, or set it to GND by setting a jumper on the application board.

Note 3: If input signal has analog delay due to the use of such circuit as RC power on reset circuit, connect both TEST pin and RESET pin to logic ICs (Schmitt input IC such as TC74HC14). In this case, control the pin capacity to require the condition $R_{stf} < 512/f_c[s]$.

Note 4: In MCU mode, the TEST pin can be disconnected as it has a pull-down resistor built-in. However, we recommend connecting it to GND level to avoid noise influence.

Note 5: If the RESET control circuit on the application board affects the Serial PROM mode to start, disconnect it by using a jumper, etc.

2.16.4 Interface Specifications for UART

The following shows the UART communication format used in serial PROM mode.

Before on-board programming can be executed, the communication format on the external controller side must also be set up in the same way as for this product.

Note that although the default baud rate is 9600 bps, it can be changed to other values as shown in Table 2.16.5. The Table 2.16.6 shows an operating frequency and baud rate in serial PROM mode. Except frequency which is not described in Table 2.16.6 can not use in serial PROM mode.

Baud rate (Default): 9600 bps

Data length: 8 bits

Parity addition: None

Stop bit length: 1 bit

Table 2.16.5 Baud Rate Modification Data

Baud rate modification data	04H	05H	06H	07H	0AH	18H	28H
Baud rate (bps)	76800	62500	57600	38400	31250	19200	9600

Table 2.16.6 Operating Frequency and Baud Rate in Serial PROM Mode

(Note 3)	Reference Baud Rate (bps)		76800		62500		57600		38400		31250		19200		9600

10	16	15.27~16.77	76923	+0.16	62500	0.00	-	-	38462	+0.16	31250	0.00	19231	+0.16	9615	+0.16

Note 1: "Ref.Frequency" and "Area" show the high frequency area supported in serial PROM mode. Except the above frequency can not be supported in serial PROM mode even though the high frequency is included in area from 2 MHz to 16 MHz.

Note 2: The total error of frequency must be kept within +/-3% so that the auto-detection of frequency is executed correctly.

Note 3: An external controller should transmit a matching data repeatedly till the TMP86FM29 transmit an echo back data. Above number indicates a transmission number of times of matching data till transmission of echo back data.

2.16.5 Command

There are five commands in serial PROM mode. After reset release, the TMP86FM29 waits a matching data (5AH).

Table 2.16.7 Command in Serial PROM Mode

Command Data	Operation Mode	Remarks
5AH	Setup	Matching data. Always start with this command after reset release.
30H	FLASH memory writing	Writing to area from 8000H to FFFFH is enable.
60H	RAM loader	Writing to area from 0050H to 062FH is enable.
90H	FLASH memory SUM output	The checksum of entire FLASH area (from 8000H to FFFFH) is output in order of the upper byte and the lower byte.
C0H	Product discrimination code output	Product discrimination code, that is expressed by 13 bytes data, is output.

2.16.6 Operation Mode

There are four operating modes in serial PROM mode: FLASH memory writing mode, RAM loader mode, FLASH memory SUM output mode and Product discrimination code output mode. For details about these modes, refer to “(1) FLASH memory writing mode” through “(4) Product discrimination code output mode”.

(1) FLASH memory writing mode

The data are written to the specified FLASH memory addresses. The controller should send the write data in the Intel Hex format (Binary). For details of writing data format, refer to “2.16.7 FLASH memory Writing Data Format”.

If no errors are encountered till the end record, the SUM of 32 Kbytes of FLASH memory is calculated and the result is returned to the controller.

To execute the FLASH memory writing mode, the TMP86FM29 checks the passwords except a blank product. If the passwords did not match, the program is not executed.

(2) RAM loader mode

The RAM loader transfers the data into the internal RAM that has been sent from the controller in Intel Hex format. When the transfer has terminated normally, the RAM loader calculates the SUM and sends the result to the controller before it starts executing the user program. After sending of SUM, the program jumps to the start address of RAM in which the first transferred data has been written. This RAM loader function provides the user's own way to control on-board programming.

To execute the RAM loader mode, the TMP86FM29 checks the passwords except a blank product. If the passwords did not match, the program is not executed.

(3) FLASH memory SUM output mode

The SUM of 32 Kbytes of FLASH memory is calculated and the result is returned to the controller.

The BOOT ROM does not support the reading function of the FLASH memory. Instead, it has this SUM command to use. By reading the SUM, it is possible to manage Revisions of application programs.

(4) Product discrimination code output mode

The product discrimination code is output as a 13-byte data, that includes the start address and the end address of ROM (In case of TMP86FM29, the start address is 8000H and the end address is FFFFH). Therefore, the controller can recognize the device information by using this function.

2.16.6.1 FLASH Writing Mode (Operation command: 30H)

Table 2.16.8 shows FLASH memory writing mode process.

Table 2.16.8 FLASH Writing Mode Process

	Number of Bytes Transferred	Transfer Data from External Controller to TMP86FM29	Baud Rate	Transfer Data from TMP86FM29 to External Controller
BOOT ROM	1st byte	Matching data (5Ah)	9600 bps	– (Baud rate auto set)
	2nd byte	–	9600 bps	OK: Echo back data (5AH) Error: Nothing transmitted
	3rd byte	Baud rate modification data (See Table 2.16.5)	9600 bps	–
	4th byte	–	9600 bps	OK: Echo back data Error: A1H × 3, A3H × 3, 62H × 3 (Note 1)
	5th byte	Operation command data (30H)	Changed new baud rate	–
	6th byte	–	Changed new baud rate	OK: Echo back data (30H) Error: A1H × 3, A3H × 3, 63H × 3 (Note 1)
	7th byte	Address 15 to 08 in which to store Password count (Note 4)	Changed new baud rate	–
	8th byte	–	Changed new baud rate	OK: Nothing transmitted Error: Nothing transmitted
	9th byte	Address 07 to 00 in which to store Password count (Note 4)	Changed new baud rate	–
	10th byte	–	Changed new baud rate	OK: Nothing transmitted Error: Nothing transmitted
	11th byte	Address 15 to 08 in which to start Password comparison (Note 4)	Changed new baud rate	–
	12th byte	–	Changed new baud rate	OK: Nothing transmitted Error: Nothing transmitted
	13th byte	Address 07 to 00 in which to start Password comparison (Note 4)	Changed new baud rate	–
	14th byte	–	Changed new baud rate	OK: Nothing transmitted Error: Nothing transmitted
	15th byte	Password string (Note 5)	Changed new baud rate	–
	:	–	–	–
	m'th byte	–	Changed new baud rate	OK: Nothing transmitted Error: Nothing transmitted
	m'th + 1 byte	Intel Hex format (binary) (Note 2)	Changed new baud rate	–
	:	–	–	–
	n'th – 2 byte	–	–	–
	n'th – 1 byte	–	Changed new baud rate	OK: SUM (High) (Note 3) Error: Nothing transmitted
	n'th byte	–	Changed new baud rate	OK: SUM (Low) (Note 3) Error: Nothing transmitted
	n'th + 1 byte	(Wait for the next operation) (command data)	Changed new baud rate	–

Note 1: "xxH × 3" denotes that operation stops after sending 3 bytes of xxH. For details, refer to "2.16.8 Error Code".

Note 2: Refer to "2.16.10 Intel Hex Format (Binary)".

Note 3: Refer to "2.16.9 Checksum (SUM)".

Note 4: Refer to "2.16.11 Passwords".

Note 5: If all data of addresses from FFE0H to FFFFH are "00H" or "FFH", the passwords comparison is not executed because the device is considered as blank product. However, it is necessary to specify the password count storage addresses and the password comparison start address even though it is a blank product. If a password error occurs, the UART function of TMP86FM29 stops without returning error code to the controller. Therefore, when a password error occurs, the TMP86FM29 should be reset by $\overline{\text{RESET}}$ pin input.

Description of FLASH memory writing mode

1. The receive data in the 1st byte is the matching data. When the boot program starts in serial PROM mode, TMP86FM29 (Mentioned as “device” hereafter) waits for the matching data (5AH) to receive. Upon receiving the matching data, it automatically adjusts the UART's initial baud rate to 9,600bps.
2. When the device has received the matching data, the device transmits the data “5AH” as an echo back to the controller. If the device can not receive the matching data, the device does not transmit the echo back data and waits for the matching data again with changing baud rate. Therefore, the controller should send the matching data continuously until the device transmits the echo back data. An external controller should transmit a matching data repeatedly till the device transmit an echo back data. The transmission number of times of matching data varies by the frequency of device. For details, refer to Table 2.16.6.
3. The receive data in the 3rd byte is the baud rate modification data. The seven kinds of baud rate modification data shown in Table 2.16.5 are available. Even if baud rate changing is no need, be sure to send the initial baud rate data (28H: 9,600 bps).
4. When the 3rd byte data is one of the baud rate modification data corresponding to the device's operating frequency, the device sends the echo back data which is the same as received baud rate modification data. Then the baud rate is changed. If the 3rd byte data does not correspond to the baud rate modification data, the device stops UART function after sending 3 bytes of baud rate modification error code: (62H). The changing of baud rate is executed after transmitting the echo back data.
5. The receive data in the 5th byte is the command data (30H) to write the FLASH memory.
6. When the 5th byte is one of the operation command data shown in Table 2.16.7, the device sends the echo back data which is the same as received operation command data (in this case, 30H). If the 5th byte data does not correspond to the operation command data, the device stops UART function after sending 3 bytes of operation command error code: (63H).
7. The 7th byte is used as an upper bit (Bit15 to bit8) of the password count storage address. When the receiving is executed correctly (No error), the device does not send any data. If the receiving error or password error occur, the device does not send any data and stops UART function.
8. The 9th byte is used as a lower bit (Bit7 to bit0) of the password count storage address. When the receiving is executed correctly (No error), the device does not send any data. If the receiving error or password error occur, the device does not send any data and stops UART function.
9. The 11th byte is used as an upper bit (Bit15 to bit8) of the password comparison start address. When the receiving is executed correctly (No error), the device does not send any data. If the receiving error or password error occur, the device does not send any data and stops UART function.
10. The 13th byte is used as a lower bit (Bit7 to bit0) of the password comparison start address. When the receiving is executed correctly (No error), the device does not send any data. If the receiving error or password error occur, the device does not send any data and stops UART function.

11. The 15th through the m'th bytes are the password data. The number of passwords is the data (N) indicated by the password count storage address. The password data are compared for N entries beginning with the password comparison start address. The controller should send N bytes of password data to the device. If the passwords do not match, the device stops UART function without returning error code to the controller. If the data of addresses from FFE0H to FFFFH are all "FFH", the comparison of passwords is not executed because the device is considered as a blank product.
12. The receive data in the m'th + 1 through n'th - 2 byte are received as binary data in Intel Hex format. No received data are echoed back to the controller. The data which is not the start mark (3AH for ":") in Intel Hex format is ignored and does not send an error code to the controller until the device receives the start mark. After receiving the start mark, the device receives the data record, that consists of length of data, address, record type, writing data and checksum. After receiving the checksum of data record, the device waits the start mark data (3AH) again. The data of data record is temporarily stored to RAM and then, is written to specified FLASH memory by page (64 bytes) writing. For details of an organization of FLASH, refer to "2.16.7 Serial PROM Mode". Since after receiving an end record, the device starts to calculate the SUM, the controller should wait the SUM after sending the end record. If receive error or Intel Hex format error occurs, the device stops UART function without returning error code to the controller.
13. The n'th - 1 and the n'th bytes are the SUM value that is sent to the controller in order of the upper byte and the lower byte. For details on how to calculate the SUM, refer to "2.16.9 Checksum (SUM)". The SUM calculation is performed after detecting the end record, but the calculation is not executed when receive error or Intel Hex format error has occurred. The time required to calculate the SUM of the 32 Kbytes of FLASH memory area is approximately 100 ms at $f_c = 16$ MHz. After the SUM calculation, the device sends the SUM data to the controller. After sending the end record, the controller can judge that the transmission has been terminated correctly by receiving the checksum.
14. After sending the SUM, the device waits for the next operation command data.

2.16.6.2 RAM Loader Mode (Operation Command: 60H)

Table 2.16.9 shows RAM loader mode process.

Table 2.16.9 RAM Loader Mode Process

	Number of Bytes Transferred	Transfer Data from External Controller to TMP86FM29	Baud Rate	Transfer Data from TMP86FM29 to External Controller
BOOT ROM	1st byte	Matching data (5AH)	9600 bps	– (Baud rate auto set)
	2nd byte	–	9600 bps	OK: Echo back data (5AH) Error: Nothing transmitted
	3rd byte	Baud rate modification data (See Table 2.16.5)	9600 bps	–
	4th byte	–	9600 bps	OK: Echo back data Error: A1H × 3, A3H × 3, 62H × 3 (Note 1)
	5th byte	Operation command data (60H)	Changed new baud rate	–
	6th byte	–	Changed new baud rate	OK: Echo back data (60H) Error: A1H × 3, A3H × 3, 63H × 3 (Note 1)
	7th byte	Address 15 to 08 in which to store Password count (Note 4)	Changed new baud rate	–
	8th byte	–	Changed new baud rate	OK: Nothing transmitted Error: Nothing transmitted
	9th byte	Address 07 to 00 in which to store Password count (Note 4)	Changed new baud rate	–
	10th byte	–	Changed new baud rate	OK: Nothing transmitted Error: Nothing transmitted
	11th byte	Address 15 to 08 in which to start Password comparison (Note 4)	Changed new baud rate	–
	12th byte	–	Changed new baud rate	OK: Nothing transmitted Error: Nothing transmitted
	13th byte	Address 07 to 00 in which to start Password comparison (Note 4)	Changed new baud rate	–
	14th byte	–	Changed new baud rate	OK: Nothing transmitted Error: Nothing transmitted
	15th byte	Password string (Note 5)	Changed new baud rate	–
	:	–	–	–
	m'th byte	–	Changed new baud rate	OK: Nothing transmitted Error: Nothing transmitted
	m'th + 1 byte	Intel Hex format (Binary) (Note 2)	Changed new baud rate	–
	:	–	–	–
	n'th – 2 byte	–	–	–
	n'th – 1 byte	–	Changed new baud rate	OK: SUM (High) (Note 3) Error: Nothing transmitted
	n'th byte	–	Changed new baud rate	OK: SUM (Low) (Note 3) Error: Nothing transmitted
RAM	–	The program jumps to the start address of RAM in which the first transferred data has been written.		

Note 1: "xxH × 3" denotes that operation stops after sending 3 bytes of xxH. For details, refer to 2.16.8 "Error Code".

Note 2: Refer to 2.16.10 "Intel Hex Format (Binary)".

Note 3: Refer to 2.16.9 "Checksum (SUM)".

Note 4: Refer to 2.16.11 "Passwords".

Note 5: If all data of addresses from FFE0H to FFFFH are "00H" or "FFH", the passwords comparison is not executed because the device is considered as blank product. However, it is necessary to specify the password count storage addresses and the password comparison start address even though it is a blank product. If a password error occurs, the UART function of TMP86FM29 stops without returning error code to the controller. Therefore, when a password error

occurs, the TMP86FM29 should be reset by $\overline{\text{RESET}}$ pin input.

Note 6: Do not send only end record after transferring of password string. If the TMP86FM29 receives the end record only after reception of password string, it does not operate correctly.

Note 7: When the FLASH power supply is turned off in user's program by setting $\text{EEPCR} < \text{MNPWDW} >$, be sure to disable the watchdog timer (WDT) or to clear the binary counter of WDT immediately before.

Description of RAM loader mode

1. The process of the 1st byte through the 4th byte are the same as FLASH memory writing mode.
2. The receive data in the 5th byte is the RAM loader command data (60H) to write the user's program to RAM.
3. When the 5th byte is one of the operation command data shown in Table 2.16.7, the device sends the echo back data which is the same as received operation command data (in this case, 60H). If the 5th byte data does not correspond to the operation command data, the device stops UART function after sending 3 bytes of operation command error code: (63H).
4. The process of the 7th byte through the m'th byte are the same as FLASH memory writing mode.
5. The receive data in the m'th + 1 through n'th - 2 byte are received as binary data in Intel Hex format. No received data are echoed back to the controller.
The data which is not the start mark (3AH for ";") in Intel Hex format is ignored and does not send an error code to the controller until the device receives the start mark. After receiving the start mark, the device receives the data record, that consists of length of data, address, record type, writing data and checksum. After receiving the checksum of data record, the device waits the start mark data (3AH) again. The data of data record is written to specified RAM by the receiving data. Since after receiving an end record, the device starts to calculate the SUM, the controller should wait the SUM after sending the end record. If receive error or Intel Hex format error occurs, the UART function of TMP86FM29 stops without returning error code to the controller.
6. The n'th - 1 and the n'th bytes are the SUM value that is sent to the controller in order of the upper byte and the lower byte. For details on how to calculate the SUM, refer to 2.16.9 "Checksum (SUM)". The SUM calculation is performed after detecting the end record, but the calculation is not executed when receive error or Intel Hex format error has occurred.
The SUM is calculated by the data written to RAM, but the length of data, address, record type and checksum in Intel Hex format are not included in SUM.
7. The boot program jumps to the first address that is received as data in Intel Hex format after sending the SUM to the controller.

2.16.6.3 FLASH Memory SUM Output Mode (Operation Command: 90H)

Table 2.16.10 shows FLASH memory SUM output mode process.

Table 2.16.10 FLASH Memory SUM Output Process

	Number of Bytes Transferred	Transfer Data from External Controller to TMP86FM29	Baud Rate	Transfer Data from TMP86FM29 to External Controller
BOOT ROM	1st byte 2nd byte	Matching data (5AH) –	9600 bps 9600 bps	– (Baud rate auto set) OK: Echo back data (5AH) Error: Nothing transmitted
	3rd byte 4th byte	Baud rate modification data (See Table 2.16.5) –	9600 bps 9600 bps	OK: Echo back data Error: A1H × 3, A3H × 3, 62H × 3 (Note 1)
	5th byte 6th byte	Operation command data (90H) –	Changed new baud rate Changed new baud rate	– OK: Echo back data (90H) Error: A1H × 3, A3H × 3, 63H × 3 (Note 1)
	7th byte	–	Changed new baud rate	OK: SUM (High) (Note 2) Error: Nothing transmitted
	8th byte	–	Changed new baud rate	OK: SUM (Low) (Note 2) Error: Nothing transmitted
	9th byte	(Wait for the next operation) (Command data)	Changed new baud rate	–

Note 1: “xxH × 3” denotes that operation stops after sending 3 bytes of xxH. For details, refer to “2.16.8 Error Code”.

Note 2: Refer to “2.16.9 Checksum (SUM)”

Description of FLASH memory SUM output mode

1. The process of the 1st byte through the 4th byte are the same as FLASH memory writing mode.
2. The receive data in the 5th byte is the FLASH memory SUM command data (90H) to calculate the entire FLASH memory.
3. When the 5th byte is one of the operation command data shown in Table 2.16.7, the device sends the echo back data which is the same as received operation command data (in this case, 90H). If the 5th byte data does not correspond to the operation command data, the device stops UART function after sending 3 bytes of operation command error code: (63H).
4. The 7th and the 8th bytes are the SUM value that is sent to the controller in order of the upper byte and the lower byte. For details on how to calculate the SUM, refer to “2.16.9 Checksum (SUM)”.
5. After sending the SUM, the device waits for the next operation command data.

2.16.6.4 Product Discrimination Code Output Mode (Operation Command: C0H)

Table 2.16.11 shows product discrimination code output mode process.

Table 2.16.11 Product Discrimination Code Output Process

	Number of Bytes Transferred	Transfer Data from External Controller to TMP86FM29	Baud Rate	Transfer Data from TMP86FM29 to External Controller
BOOT ROM	1st byte	Matching data (5AH)	9600 bps	– (Baud rate auto set)
	2nd byte	–	9600 bps	OK: Echo back data (5AH) Error: Nothing transmitted
	3rd byte	Baud rate modification data (See Table 2.16.5)	9600 bps	OK: Echo back data Error: A1H × 3, A3H × 3, 62H × 3 (Note 1)
	4th byte	–	9600 bps	
	5th byte	Operation command data (C0H)	Changed new baud rate	– OK: Echo back data (C0H) Error: A1H × 3, A3H × 3, 63H × 3 (Note 1)
	6th byte	–	Changed new baud rate	
	7th byte		Changed new baud rate	3AH Start mark
	8th byte		Changed new baud rate	0AH The number of transfer data (from 9th to 18th byte)
	9th byte		Changed new baud rate	02H Length of address (2 bytes)
	10th byte		Changed new baud rate	00H Reserved data
	11th byte		Changed new baud rate	00H Reserved data
	12th byte		Changed new baud rate	00H Reserved data
	13th byte		Changed new baud rate	00H Reserved data
	14th byte		Changed new baud rate	01H The number of ROM block (1 block)
	15th byte		Changed new baud rate	80H First address of ROM
	16th byte		Changed new baud rate	00H
	17th byte		Changed new baud rate	FFH End address of ROM
	18th byte		Changed new baud rate	FFH
	19th byte		Changed new baud rate	7FH Checksum of transferred data (from 9th to 18th byte)
	20th byte	(Wait for the next operation) (Command data)	Changed new baud rate	–

Note: “xxH × 3” denotes that operation stops after sending 3 bytes of xxH. For details, refer to “2.16.8 Error Code”.

Description of product discrimination code output mode

1. The process of the 1st byte through the 4th byte are the same as FLASH memory writing mode.
2. The receive data in the 5th byte is the product discrimination code output command data (C0H).
3. When the 5th byte is one of the operation command data shown in Table 2.16.7, the device sends the echo back data which is the same as received operation command data (in this case, C0H). If the 5th byte data does not correspond to the operation command data, the device stops UART function after sending 3 bytes of operation command error code: (63H).
4. The 7th and the 19th bytes are the product discrimination code. For details, refer to 2.16.12 “Product Discrimination Code”.
5. After sending the SUM, the device waits for the next operation command data.

2.16.7 FLASH memory Writing Data Format

FLASH area of TMP86FM29 consists of 512 pages and one page size is 64 bytes.

Writing to FLASH is executed by page writing. Therefore, it is necessary to send 64 bytes data (for one page) even though only a few bytes data are written. Figure 2.16.5 shows an organization of FLASH area. When the controller sends the writing data to the device, be sure to keep the format described below.

1. The address of data after receiving the FLASH writing command should be the first address of page. For example, in case of page 2, the first address should be 8080H.
2. If the last data's address of data record is not end address of page, the address of the next data record should be the address + 1. For example, if the last data's address is 802FH (Page 0), the address of the next data record should be 8030H (Page 0).

Ex)

:10802000202122232425262728292A2B2C2D2E2FD8 '8020H to 802FH data

:10803000303132333435363738393A3B3C3D3E3FC8 '8030H to 803FH data

3. The last data's address of data record immediately before sending the end record should be the last address of page. For example, in case of page 1, the last data's address of data record should be 807FH.

Ex)

:10807000303132333435363738393A3B3C3D3E3FB88 '8070H to 807FH data

:00000001FF 'End record

Note: Do not write only the addresses from FFE0H to FFFFH when all data of FLASH memory are the same data. If these area are only written, the next operation can not be executed because of password error.

Address	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F
8000H	F															
8010H																
8020H																
8030H																E
8040H	F															
8050H																
8060H																
8070H																E
8080H	F															
8090H																
80A0H																
80B0H																E
80C0H																
...																
FF70H																E
FF80H	F															
FF90H																
FFA0H																
FFB0H																E
FFC0H	F															
FFD0H																
FFE0H																
FFF0H																E

Note: "F" shows the first address of each page and "E" shows the last address of each page.

Figure 2.16.5 Organization of FLASH Area

2.16.8 Error Code

When the device detects an error, the error codes are sent to the controller.

Table 2.16.12 Error Code

Transmit Data	Meaning of Transmit Data
62H, 62H, 62H	Baud rate modification error occurred.
63H, 63H, 63H	Operating command error occurred.
A1H, A1H, A1H	Framing error in received data occurred.
A3H, A3H, A3H	Overrun error in received data occurred.

Note1: If password error occurs, the TMP86FM29 doesn't send error codes.

2.16.9 Checksum (SUM)

(1) Calculation method

SUM consists of byte + byte... + byte, the checksum of which is returned in word as the result.

Namely, data is read out in byte and checksum of which is calculated, with the result returned in word.

Example:

	If the data to be calculated consists of the four bytes shown to the left, SUM of the data is $A1H + B2H + C3H + D4H = 02EAH$ SUM (HIGH) = 02H SUM (LOW) = EAH
A1H	
B2H	
C3H	
D4H	

The SUM returned when executing the FLASH memory write command, RAM loader command, or FLASH memory SUM command is calculated in the manner shown above.

(2) Calculation data

The data from which SUM is calculated are listed in Table 2.16.13 below.

Table 2.16.13 Checksum Calculation Data

Operating Mode	Calculation Data	Remarks
FLASH memory writing mode	Data in the entire area (32 Kbytes) of FLASH memory	Even when written to part of the FLASH area, data in the entire memory area (32 Kbytes) is calculated.
FLASH memory SUM output mode		The length of data, address, record type and checksum in Intel Hex format are not included in SUM.
RAM loader mode	Data written to RAM	The length of data, address, record type and checksum in Intel Hex format are not included in SUM.
Product Discrimination Code Output mode	Checksum of transferred data (from 9th to 18th byte)	For details, refer to 2.16.12 Product Discrimination Code.

2.16.10 Intel Hex Format (Binary)

1. After receiving the checksum of a record, the device waits for the start mark data (3AH for “:”) of the next record. Therefore, the device ignores the data, which does not match the start mark data after receiving the checksum of a record.
2. Make sure that once the controller program has finished sending the checksum of the end record, it does not send anything and waits for two bytes of data to be received (Upper and lower bytes of checksum). This is because after receiving the checksum of the end record, the boot program calculates the checksum and returns the calculated checksum in two bytes to the controller.
3. If a receive error or Intel Hex format error occurs, the UART function of TMP86FM29 stops without returning error code to the controller. In the following cases, an Intel Hex format error occurs:
 - When the record type is not 00H, 01H, or 02H
 - When a SUM error occurred
 - When the data length of an extended record (Type = 02H) is not 02H
 - When the address of an extended record (Type = 02H) is larger than 1000H and after that, receives the data record
 - When the data length of the end record (Type = 01H) is not 00H

2.16.11 Passwords

The eight or more bytes consecutive data in flash memory area can be used as password. In password check, TMP86FM29 compares these data with data which are transmitted from the external controller. The area in which passwords can be specified is located at addresses 8000H to FF9FH. The area from FFA0H to FFFFH can not be specified as passwords area. The device compares the stored passwords with the passwords, which are received from the controller. If all data of addresses from FFE0H to FFFFH are “00H” or “FFH”, the passwords comparison is not executed because the device is considered as blank product. It is necessary to specify the password count storage addresses and the password comparison start address even though it is a blank product. Table 2.16.14 shows the password setting in the blank product and non blank product.

Table 2.16.14 Password Setting in the Blank Product and Non Blank Product

Password	Blank Product (Note 1)	Non Blank Product
PNSA (Password count storage addresses)	$8000H \leq PNSA \leq FF9FH$	$8000H \leq PNSA \leq FF9FH$
PCSA (Password comparison start address)	$8000H \leq PCSA \leq FF9FH$	$8000H \leq PCSA \leq FFA0 - N$
N (Password count)	*	$8 \leq N$
Setting of password	No need	Need (Note 2)

Note 1: When all data of addresses from FFE0H to FFFFH area are "00H" or "FFH", the device is judged as blank product.

Note 2: The same three or more bytes consecutive data can not be used as password. When the password includes the same consecutive data (three or more bytes), the password error occurs. If the password error occurred, the UART function of device stops without returning error code.

Note 3: *: Don't care.

Note 4: When the password doesn't match the above condition, the password error occurs. If the password error occurred, the UART function of device stops without returning error code.

Note 5: In case of the blank product, the device receives Intel Hex Format immediately after receiving PCSA without receiving password strings. In this time, because the device ignores the data except the start mark data (3AH for ":") as Intel Hex Format data, even if external controller transmitted dummy password strings, process operates correctly. However, if the dummy password strings contain data "3AH", the device detects it as start mark data mistakenly, and device stops process without returning error code. Therefore, if these process becomes issue, the external controller should not transmit the dummy password strings.

Figure 2.16.6 Example of password compare

2.16.11.1 Confirmation Method of the Blank Product and Non Blank Product

The external controller can confirm whether the device is the blank product or not, by transmission of data described below.

- (1) Executes FLASH memory writing mode or RAM loader mode.
- (2) Transmits the PNSA and PCSA.
- (3) Transmits the end record.
- (4) In case of the blank product, the device sends checksum of flash memory. In case of the non blank product, the device doesn't send checksum of flash memory but the UART function stops without sending any data.

The external controller can confirm the blank product and non blank product by receiving checksum.

Note: When the UART function stops in non blank product, the TMP86FM29 should be reset by pin reset input for restarting the Serial PROM Mode.

2.16.11.2 Password String

A string of passwords in the received data are compared with the data in the FLASH memory. In the following cases, a password error occurs:

- When the received data does not match the data in the FLASH memory

2.16.11.3 Handling of Password Error

If a password error occurs, the UART function of TMP86FM29 stops without returning error code to the controller. Therefore, when a password error occurs, the TMP86FM29 should be reset by RESET pin input.

2.16.12 Product Discrimination Code

The product discrimination code is a 13-byte data, that includes the start address and the end address of ROM. Table 2.16.15 shows the product discrimination code format.

Table 2.16.15 Product Discrimination Code Format

Data	The Meaning of Data	In Case of TMP86FM29
1st	Start Mark (3AH)	3AH
2nd	The number of transfer data (from 3rd to 12th byte)	0AH
3rd	Length of address	02H
4th	Reserved data	00H
5th	Reserved data	00H
6th	Reserved data	00H
7th	Reserved data	00H
8th	The number of ROM block	01H
9th	The upper byte of the first address of ROM	80H
10th	The lower byte of the first address of ROM	00H
11th	The upper byte of the end address of ROM	FFH
12th	The lower byte of the end address of ROM	FFH
13th	Checksum of transferred data (from 3rd to 12th byte)	7FH

2.16.13 Flowchart

2.16.14 UART Timing

Table 2.16.16 UART Timing-1 (VDD = 2.7 V to 3.6 V, fc = 2 MHz to 16 MHz, Ta = 25°C)

Parameter	Symbol	The Number of Clock (fc)	Required Minimum Time	
			At fc = 2 MHz	At fc = 16 MHz
Time from the reception of a matching data until the output of an echo back	CMeb1	Approx. 600	300 μ s	37.5 μ s
Time from the reception of a baud rate modification data until the output of an echo back	CMeb2	Approx. 700	350 μ s	43.7 μ s
Time from the reception of an operation command until the output of an echo back	CMeb3	Approx. 600	300 μ s	37.5 μ s
Calculation time of checksum	CKsm	Approx. 1573000	786.5 ms	98.3 ms

Table 2.16.17 UART Timing-2 (VDD = 2.7 V to 3.6 V, fc = 2 MHz to 16 MHz, Ta = 25°C)

Parameter	Symbol	The Number of Clock (fc)	Required Minimum Time	
			At fc = 2 MHz	At fc = 16 MHz
Time from reset release until acceptance of start bit of RXD pin	RXsup	110000	55 ms	6.9 ms
Time between a matching data and the next matching data	CMtr1	28500	14.3 ms	1.8 ms
Time from the echo back of matching data until the acceptance of baud rate modification data	CMtr2	600	300 μ s	37.5 μ s
Time from the output of echo back of baud rate modification data until the acceptance of an operation command	CMtr3	750	375 μ s	46.9 μ s
Time from the output of echo back of operation command until the acceptance of Password count storage addresses	CMtr4	950	475 μ s	59.4 μ s

Input/Output Circuitry

(1) Control pins

The input/output circuitries of the TMP86FM29 control pins are shown below.

Control Pin	I/O	Input/Output Circuitry		Remarks
XIN XOUT	Input Output			Resonator connecting pins (high-frequency) $R_f = 3\text{ M}\Omega$ (typ.) $R_O = 1\text{ k}\Omega$ (typ.)
XTIN XTOUT	Input Output	NORMAL1 mode Refer to port P2	NORMAL2 mode 	Resonator connecting pins (Low-frequency) $R_f = 20\text{ M}\Omega$ (typ.) $R_O = 220\text{ k}\Omega$ (typ.)
$\overline{\text{RESET}}$	I/O			Sink open drain output Hysteresis input Pull-up resistor $R_{IN} = 220\text{ k}\Omega$ (typ.)
$\overline{\text{STOP}} / \text{INT5}$	Input			Hysteresis input
TEST	Input			Pull-down resistor $R_{IN} = 70\text{ k}\Omega$ (typ.)

(2) Input/Output Ports

Port	I/O	Input/Output Circuitry	Remarks
P1	I/O	Initial "High-Z"	Sink open drain output Hysteresis input
P5 P7	I/O	Initial "High-Z"	Sink open drain output
P2	I/O	Initial "High-Z"	Sink open drain output Hysteresis input
P3	I/O	Initial "High-Z"	Sink open drain or C-MOS output Hysteresis input High current output (Nch) (Programmable port option)
P6	I/O	Initial "High-Z"	Tri-state I/O Hysteresis input

Note: Port P1, P5 and P7 are sink open drain output. But they are also used as a segment output of LCD. Therefore, absolute maximum ratings of port input voltage should be used in -0.3 to $V_{DD} + 0.3$ [V].

Electrical Characteristics

Absolute Maximum Ratings ($V_{SS} = 0\text{ V}$)

Parameter	Symbol	Pins	Rating	Unit
Supply voltage	V_{DD}		-0.3 to 4.0	V
	V_{LCD}	V3 pin	-0.3 to 4.0	
Input voltage	V_{IN}		-0.3 to $V_{DD} + 0.3$	
Output voltage	V_{OUT1}		-0.3 to $V_{DD} + 0.3$	
Output current (Per 1 pin)	I_{OUT1}	P3, P6 ports	-1.8	mA
	I_{OUT2}	P1, P2, P5, P6, P7 ports	3.2	
	I_{OUT3}	P3 ports	30	
Output current (Total)	ΣI_{OUT2}	P1, P2, P5, P6, P7 ports	60	
	ΣI_{OUT3}	P3 ports	80	
Power dissipation [$T_{opr} = 85^{\circ}\text{C}$]	PD		350	mW
Soldering temperature (Time)	T_{sld}		260 (10 s)	$^{\circ}\text{C}$
Storage temperature	T_{stg}		-55 to 125	
Operating temperature	T_{opr}		-40 to 85	

Note: The absolute maximum ratings are rated values which must not be exceeded during operation, even for an instant. Any one of the ratings must not be exceeded. If any absolute maximum rating is exceeded, a device may break down or its performance may be degraded, causing it to catch fire or explode resulting in injury to the user. Thus, when designing products which include this device, ensure that no absolute maximum rating value will ever be exceeded.

Recommended Operating Condition-1 (MCU mode) ($V_{SS} = 0\text{ V}$, $T_{opr} = -40\text{ to }85^{\circ}\text{C}$)

Parameter	Symbol	Pins	Condition		Min	Max	Unit
Supply voltage	V _{DD}		fc = 16 MHz	NORMAL1, 2 mode	2.7	3.6	V
				IDLE0, 1, 2 mode			
			fc = 8 MHz (In case of connecting the resonator)	NORMAL1, 2 mode	1.8		
				IDLE0, 1, 2 mode			
			fc = 4.2 MHz (In case of external clock input)	NORMAL1, 2 mode	1.8		
				IDLE0, 1, 2 mode			
			fs = 32.768 kHz	SLOW1, 2 mode			
				SLEEP0, 1, 2 mode			
	STOP mode						
Input high level	V _{IH1}	Except Hysteresis input	V _{DD} ≥ 2.7 V	V _{DD} × 0.70	V _{DD}		
	V _{IH2}	Hysteresis input		V _{DD} × 0.75			
	V _{IH3}		V _{DD} < 2.7 V	V _{DD} × 0.90			
Input low level	V _{IL1}	Except Hysteresis input	V _{DD} ≥ 2.7 V	0	V _{DD} × 0.30		
	V _{IL2}	Hysteresis input		V _{DD} × 0.25			
	V _{IL3}		V _{DD} < 2.7 V	V _{DD} × 0.10			
Clock frequency (In case of connecting the resonator)	fc	XIN, XOUT	V _{DD} = 1.8 to 3.6 V	1.0	8.0	MHz	
			V _{DD} = 2.7 to 3.6 V		16.0		
	fs	XTIN, XTOUT	V _{DD} = 1.8 to 3.6 V	30.0	34.0	kHz	
Clock frequency (In case of external clock input)	fc	XIN, XOUT	V _{DD} = 1.8 to 3.6 V	1.0	4.2	MHz	
			V _{DD} = 2.7 to 3.6 V		16.0		
		fs	XTIN, XTOUT	V _{DD} = 1.8 to 3.6 V	30.0	34.0	kHz
LCD reference voltage	V1		Booster circuit is enable (V3 ≥ V _{DD})	0.8	1.2	V	
Capacity for LCD booster circuit	C _{LCD}		LCD booster circuit is enable (V3 ≥ V _{DD})	0.1	0.47	μF	

Note: The recommended operating conditions for a device are operating conditions under which it can be guaranteed that the device will operate as specified. If the device is used under operating conditions other than the recommended operating conditions (Supply voltage, operating temperature range, specified AC/DC values etc.), malfunction may occur. Thus, when designing products which include this device, ensure that the recommended operating conditions for the device are always adhered to.

Recommended Operating Condition-2 (Serial PROM mode) ($V_{SS} = 0\text{ V}$, $T_{opr} = 25^{\circ}\text{C} \pm 5^{\circ}\text{C}$)

Parameter	Symbol	Pins	Condition	Min	Max	Unit
Supply voltage	V_{DD}		$2\text{ MHz} \leq f_c \leq 16\text{ MHz}$	2.7	3.6	V
Clock frequency	f_c	XIN, XOUT	$V_{DD} = 2.7\text{ to }3.6\text{ V}$	2.0	16.0	MHz

Note: The operating temperature area of serial PROM mode is $25^{\circ}\text{C} \pm 5^{\circ}\text{C}$ and the operating area of high frequency of serial PROM mode is different from MCU mode.

DC Characteristics (V_{SS} = 0 V, T_{opr} = -40 to 85°C)

Parameter	Symbol	Pins		Condition	Min	Typ.	Max	Unit	
Hysteresis voltage	V _{HS}	Hysteresis input		V _{DD} = 3.3 V	–	0.4	–	V	
Input current	I _{IN1}	TEST		V _{DD} = 3.6 V, V _{IN} = 0 V	–	–	–5	μA	
	I _{IN2}	Sink open drain, Tri-state		V _{DD} = 3.6 V, V _{IN} = 3.6 V/0 V	–	–	±5		
	I _{IN3}	RESET		V _{DD} = 3.6 V, V _{IN} = 3.6 V	–	–	+5		
Input resistance	R _{IN1}	TEST pull down		V _{DD} = 3.6 V, V _{IN} = 3.6 V	–	70	–	kΩ	
	R _{IN2}	RESET pull up		V _{DD} = 3.6 V, V _{IN} = 0 V	100	220	450		
High frequency feedback resistor	R _{FB}	XOUT		V _{DD} = 3.6 V	–	3	–	MΩ	
Low frequency feedback resistor	R _{FBT}	XTOUT		V _{DD} = 3.6 V	–	20	–		
Output leakage current	I _{LO}	Sink open drain, Tri-state		V _{DD} = 3.6 V V _{OUT} = 3.4V/0.2 V	–	–	±10	μA	
Output high voltage	V _{OH}	CMOS, Tri-state		V _{DD} = 3.6 V, I _{OH} = –0.6 mA	3.2	–	–	V	
Output low voltage	V _{OL}	Except XOUT, P3 port		V _{DD} = 3.6 V, I _{OL} = 0.9 mA	–	–	0.4		
Output low current	I _{OL}	P3 port		V _{DD} = 3.6 V, V _{OL} = 1.0 V	–	6	–	mA	
LCD output voltage (LCD booster is enable)	V _{2-3OUT}	V2 pin		V3 ≥ V _{DD} Reference supply pin: V1 SEG/COM pin: No load	–	V1 x 2	–	V	
		V3 pin			–	V1 x 3	–		
Supply current in NORMAL 1, 2 mode		Fetch area	Flash area	V _{DD} = 3.6 V MNP = “1”	–	5.3	7.3	mA	
RAM area			V _{IN} = 3.4 V/0.2 V MNP = “0”	–	3.4	5.2			
Supply current in IDLE 0, 1, 2 mode			Fetch area	Flash area	f _c = 16 MHz MNP•ATP = “1”	–	3.1		5.2
				RAM area	f _s = 32.768 kHz MNP•ATP = “0”	–	2.2		4.2
Supply current in SLOW 1 mode		Fetch area	Flash area	V _{DD} = 3.0 V V _{IN} = 2.8 V/0.2 V f _s = 32.768 kHz	MNP = “1”	–	850	1200	μA
RAM area			MNP = “0”		–	7	19		
Supply current in SLEEP 1 mode			MNP•ATP = “1”		–	850	1200		
Supply current in SLEEP 0 mode			MNP•ATP = “0”		–	5.5	17		
Supply current in STOP mode			MNP•ATP = “1”		–	850	1200		
			MNP•ATP = “0”		–	4.5	15		
				V _{DD} = 3.6 V V _{IN} = 3.4 V/0.2 V	–	0.5	10		

Note 1: Typical values show those at T_{opr} = 25°C.

Note 2: Input current (I_{IN1}, I_{IN2}): The current through pull-up or pull-down resistor is not included.

Note 3: I_{DD} does not include I_{REF} current.

Note 4: The supply currents of SLOW2 and SLEEP2 modes are equivalent to IDLE0, IDLE1, IDLE2.

Note 5: MNP (MNPWDW) shows bit0 in EEPCCR register and ATP (ATPWDW) shows bit1 in EEPCCR register.

Note 6: "Fetch" means reading operation of FLASH data as an instruction by CPU.

AD Conversion Characteristics

(V_{SS} = 0.0 V, 2.7 V ≤ V_{DD} ≤ 3.6 V, T_{opr} = −40 to 85°C)

Parameter	Symbol	Condition	Min	Typ.	Max	Unit
Analog reference voltage	V _{AREF}		A _{VDD} – 1.0	–	A _{VDD}	V
Power supply voltage of analog control circuit	A _{VDD}		V _{DD}			
Analog reference voltage range (Note 4)	ΔV _{AREF}		2.5	–	–	
Analog input voltage	V _{AIN}		V _{SS}	–	V _{AREF}	
Power supply current of analog reference voltage	I _{REF}	V _{DD} = A _{VDD} = V _{AREF} = 3.6 V V _{SS} = 0.0 V	–	0.35	0.61	mA
Non linearity error		V _{DD} = A _{VDD} = 2.7 V V _{SS} = 0.0 V V _{AREF} = 2.7 V	–	–	±2	LSB
Zero point error			–	–	±2	
Full scale error			–	–	±2	
Total error			–	–	±2	

(V_{SS} = 0.0 V, 2.0 V ≤ V_{DD} < 2.7 V, T_{opr} = −40 to 85°C)

Parameter	Symbol	Condition	Min	Typ.	Max	Unit
Analog reference voltage	V _{AREF}		$A_{VDD} - 0.6$	–	A _{VDD}	V
Power supply voltage of analog control circuit	A _{VDD}		V _{DD}			
Analog reference voltage range (Note 4)	ΔV _{AREF}		2.0	–	–	
Analog input voltage	V _{AIN}		V _{SS}	–	V _{AREF}	
Power supply current of analog reference voltage	I _{REF}	V _{DD} = A _{VDD} = V _{AREF} = 2.0V V _{SS} = 0.0 V	–	0.20	0.34	mA
Non linearity error		V _{DD} = A _{VDD} = 2.0 V V _{SS} = 0.0 V V _{AREF} = 2.0 V	–	–	±4	LSB
Zero point error			–	–	±4	
Full scale error			–	–	±4	
Total error			–	–	±4	

(V_{SS} = 0.0 V, 1.8 V ≤ V_{DD} < 2.0 V, T_{opr} = −10 to 85°C) (Note 5)

Parameter	Symbol	Condition	Min	Typ.	Max	Unit
Analog reference voltage	V _{AREF}		A _{VDD} − 0.1	–	A _{VDD}	V
Power supply voltage of analog control circuit	A _{VDD}		V _{DD}			
Analog reference voltage range (Note 4)	ΔV _{AREF}		1.8	–	–	
Analog input voltage	V _{AIN}		V _{SS}	–	V _{AREF}	
Power supply current of analog reference voltage	I _{REF}	V _{DD} = A _{VDD} = V _{AREF} = 1.8 V V _{SS} = 0.0 V	–	0.18	0.31	mA
Non linearity error		V _{DD} = A _{VDD} = 1.8 V V _{SS} = 0.0 V V _{AREF} = 1.8 V	–	–	±4	LSB
Zero point error			–	–	±4	
Full scale error			–	–	±4	
Total error			–	–	±4	

Note 1: The total error includes all errors except a quantization error, and is defined as a maximum deviation from the ideal conversion line.

Note 2: Conversion time is different in recommended value by power supply voltage.
About conversion time, please refer to “2.15.2 Register configuration”.

Note 3: Please use input voltage to AIN input Pin in limit of V_{AREF} − V_{SS}.
When voltage of range outside is input, conversion value becomes unsettled and gives affect to other channel conversion value.

Note 4: Analog Reference Voltage Range: ΔV_{AREF} = V_{AREF} − V_{SS}

Note 5: When AD is used with V_{DD} < 2.0 V, the guaranteed temperature range varies with the operating voltage.

Note 6: When AD converter is not used, fix the A_{VDD} pin and V_{AREF} pin on the V_{DD} level.

AC Characteristics

(V_{SS} = 0 V, V_{DD} = 2.7 to 3.6 V, T_{opr} = -40 to 85°C)

Parameter	Symbol	Condition	Min	Typ.	Max	Unit
Machine cycle time	tcy	NORMAL1, 2 mode	0.25	–	4	μs
		IDLE1, 2 mode				
		SLOW1, 2 mode	117.6	–	133.3	
		SLEEP1, 2 mode				
High Level clock pulse width	twcH	For external clock operation (XIN input), fc = 16 MHz	–	31.25	–	ns
Low level clock pulse width	twcL					
High level clock pulse width	twcH	For external clock operation (XTIN input), fs = 32.768 kHz	–	15.26	–	μs
Low level clock pulse width	twcL					

(V_{SS} = 0 V, V_{DD} = 1.8 to 3.6 V, T_{opr} = -40 to 85°C)

Parameter	Symbol	Condition	Min	Typ.	Max	Unit
Machine cycle time	tcy	NORMAL1, 2 mode	0.5	—	4	μs
		IDLE1, 2 mode				
		SLOW1, 2 mode	117.6	—	133.3	
		SLEEP1, 2 mode				
High level clock pulse width	twcH	For external clock operation (XIN input), fc = 4.2 MHz	—	119.04	—	ns
Low level clock pulse width	twcL					
High level clock pulse width	twcH	For external clock operation (XTIN input), fs = 32.768 kHz	—	15.26	—	μs
Low level clock pulse width	twcL					

Timer Counter 1 input (ECIN) Characteristics

(V_{SS} = 0 V, T_{opr} = -40 to 85°C)

Parameter	Symbol	Condition		Min	Typ.	Max	Unit
TC1 input (ECIN input)	t _{TC1}	Frequency measurement mode V _{DD} = 2.7 to 3.6 V	Single edge count	—	—	16	MHz
			Both edge count				
		Frequency measurement mode V _{DD} = 1.8 to 2.7 V	Single edge count	—	—	8	
			Both edge count				

Flash Characteristics

(V_{SS} = 0 V)

Parameter	Condition	Min	Typ.	Max	Unit
Number of guaranteed writes (page writing) to Flash memory in serial PROM mode	V _{DD} = 2.7 to 3.6 V, 2 MHz ≤ fc ≤ 16 MHz (T _{opr} = 25°C ± 5°C)	—	—	10 ⁵	Times

Recommended Oscillating Conditions

Note 1: An electrical shield by metal shield plate on the surface of IC package is recommended in order to protect the device from the high electric field stress applied from CRT (Cathodic Ray Tube) for continuous reliable operation.

Note 2: The product numbers and specifications of the resonators by Murata Manufacturing Co., Ltd. are subject to change. For up-to-date information, please refer to the following
