DESCRIPTION

The SY58011U is a 2.5V/3.3V precision, high-speed, fully differential 1:2 CML fanout buffer. Optimized to provide two identical output copies with less than 15ps of skew and less than 10ps_(pk-pk) total jitter, the SY58011U can process clock signals as fast as 7GHz or data patterns up to 10.7Gbps.

The differential input includes Micrel's unique, 3-pin input termination architecture that interfaces to LVPECL, LVDS, or CML differential signals, (AC-coupled or DC-coupled) as small as 100mV without any level-shifting or termination resistor networks in the signal path. For AC-coupled input interface applications, an on-board output reference voltage (V_{REF-AC}) is provided to bias the V_T pin. The outputs are compatible with 400mV typical swing into 50Ω loads, with extremely fast rise/fall times guaranteed to be less than 60ps.

The SY58011U operates from a 2.5V ±5% supply or 3.3V ±10% supply and is guaranteed over the full industrial temperature range (-40°C to +85°C). For applications that require LVPECL outputs, consider the SY58012U or SY58013U 1:2 fanout buffer with 800mV and 400mV output swing, respectively. The SY58011U is part of Micrel's high-speed, Precision Edge® product line. Datasheets and support documentation can be found on Micrel's web site at www.micrel.com.

PIN DESCRIPTION

Pin Number	Pin Name	Pin Function
1, 4	IN, /IN	Differential Input: This input pair is the signal to be buffered. Each pin of this pair internally terminates with 50Ω to the V_T pin. Note that this input will default to an indeterminate state if left open. See "Input Interface Applications" section.
2	VT	Input Termination Center-Tap: Each input terminates to this pin. The V_T pin provides a center-tap for each input (IN, /IN) to a termination network for maximum interface flexibility. See "Input Interface Applications" section.
3	VREF-AC	Reference Output Voltage: This output biases to $V_{CC} - 1.2\text{V}$. It is used when AC-coupling the inputs (IN, /IN). Connect V_{REF-AC} directly to the V_T pin. Bypass with $0.01\mu\text{F}$ low ESR capacitor to V_{CC} . Maximum current source or sink is 0.5mA . See "Input Interface Applications" section.
5, 8, 13, 16	VCC	Positive Power Supply: Bypass with $0.1\mu\text{F}/0.01\mu\text{F}$ low ESR capacitors as close to the V_{CC} pins as possible.
6, 7, 14, 15	GND, (Exposed Pad)	Ground. Exposed pad must be connected to a ground plane that is the same potential as the ground pin.
12, 11 9, 10	Q0, /Q0, Q1, /Q1	CML Differential Output Pairs: Differential buffered output copy of the input signal. The output swing is typically 400mV . Unused output pairs may be left floating with no impact on jitter. See "CML Output Termination" section.

Notes:

1. Permanent device damage may occur if absolute maximum ratings are exceeded. This is a stress rating only and functional operation is not implied at conditions other than those detailed in the operational sections of this data sheet. Exposure to absolute maximum ratings conditions for extended periods may affect device reliability.
2. The data sheet limits are not guaranteed if the device is operated beyond the operating ratings.
3. Thermal performance assumes exposed pad is soldered (or equivalent) to the device's most negative potential (gnd) on the pcb.
4. Due to the limited drive capability, use for input of the same package only.
5. The circuit is designed to meet the dc specifications shown in the above table after thermal equilibrium has been established.
6. V_{IH} (min) not lower than 1.2V.

9. Skew is defined for two parts with identical power supply voltages at the same temperature and with no skew of the edges at the respective inputs.
10. RJ is measured with a K28.7 comma detect character pattern, measured at 10.7Gbps and 2.5Gbps/3.2Gbps.
11. DJ is measured at 10.7Gbps and 2.5Gbps/3.2Gbps with both K28.5 and $2^{23}-1$ PRBS pattern
12. Cycle-to-cycle jitter definition: The variation of periods between adjacent cycles, $T_n - T_{n-1}$ where T is the time between rising edges of the output signal.
13. Total jitter definition: With an ideal clock input of frequency $\leq f_{MAX}$, no more than one output edge in 10^{12} output edges will deviate by more than the specified peak-to-peak jitter value.
