STM32U5Fxxx

2.5D and vector graphics, JPEG codec, LTDC, MIPI®DSI, 160 MHz ULP Cortex®-M33 MCU, up to 4 MB flash, 3 MB SRAM

Datasheet - production data

Features

Includes ST state-of-the-art patented technology

Ultra-low-power with FlexPowerControl

- 1.71 V to 3.6 V power supply
- - 40 °C to + 85°C temperature range
- LPBAM: autonomous peripherals with DMA, functional down to Stop 2 mode
- V_{BAT} mode: supply for RTC, 32 x 32-bit backup registers and 2-Kbyte backup SRAM
- 150 nA Shutdown mode (24 wake-up pins)
- 195 nA Standby mode (24 wake-up pins)
- 480 nA Standby mode with RTC
- 2.05 µA Stop 3 mode with 40-Kbyte SRAM
- 8.25 µA Stop 3 mode with 3-Mbyte SRAM
- 4.05 µA Stop 2 mode with 40-Kbyte SRAM
- 15.5 µA Stop 2 mode with 3-Mbyte SRAM
- 18.6 µA/MHz Run mode at 3.3 V

Core

- Arm® 32-bit Cortex®-M33 CPU with TrustZone®, MPU, DSP, and FPU

ART Accelerator

- 32-Kbyte ICACHE allowing 0-wait-state execution from flash and external memories: frequency up to 160 MHz, 240 DMIPS
- 16-Kbyte data cache for external memories

Power management

- Embedded regulator (LDO) and SMPS step-down converter supporting switch on-the-fly and voltage scaling

Performance benchmark

- 1.5 DMIPS/MHz (Dhrystone 2.1)
- 655 CoreMark® (4.09 CoreMark®/MHz)

LQFP100 (14 x 14 mm) LQFP144 (20 x 20 mm) | UFBGA144 (10 x 10 mm) | WLCSP208 (5.8 x 5.6 mm) | TFBGA216 (13 x 13 mm)

Memories

- Up to 4-Mbyte flash memory with ECC, 2 banks read-while-write, including 512 Kbytes with 100 kcycles
- With SRAM3 ECC off: 3026-Kbyte RAM including 66 Kbytes with ECC
- With SRAM3 ECC on: 2962-Kbyte RAM including 322 Kbytes with ECC
- External memory interface supporting SRAM, PSRAM, NOR, NAND and FRAM memories
- 2 Octo-SPI memory interfaces
- HSPI memory interface up to 160 MHz

Rich graphic features

- Neo-Chrom VG processor (GPU2D) accelerating any angle rotation, scaling and perspective correct texture mapping, and vector graphics
- Chrom-ART Accelerator (DMA2D) for enhanced graphic content creation
- Chrom-GRC (GFXMMU) allowing up to 20 % of graphic resources optimization
- MIPI® DSI Host controller with two DSI lanes running at up to 500 Mbit/s each
- LCD-TFT controller (LTDC)
- Digital camera interface
- Hardware JPEG codec

Product label

SUSTAINABLE TECHNOLOGY

This is information on a product in full production. www.st.com

Downloaded from Arrow.com.

- Dedicated graphic timer

General-purpose input/outputs

- Up to 151 fast I/Os with interrupt capability most 5V-tolerant and up to 14 I/Os with independent supply down to 1.08 V

Clock management

- 4 to 50 MHz crystal oscillator
- 32 kHz crystal oscillator for RTC (LSE)
- Internal 16 MHz factory-trimmed RC (± 1 %)
- Internal low-power 32 kHz RC (± 5 %)
- 2 internal multispeed 100 kHz to 48 MHz oscillators, including one auto-trimmed by LSE
- Internal 48 MHz
- 3 PLLs for system clock, USB, audio, ADC

Security

- Arm® TrustZone® and securable I/Os, memories and peripherals
- Flexible life-cycle scheme with RDP and password-protected debug
- Root of trust thanks to unique boot entry and secure hide-protection area (HDP)
- SFI (secure firmware installation) thanks to embedded RSS (root secure services)
- Secure data storage with hardware unique key (HUK)
- Secure firmware upgrade support with TF-M
- HASH hardware accelerator
- True random number generator, NIST SP800-90B compliant
- 96-bit unique ID
- 512-byte OTP (one-time programmable)
- Active tampers

Up to 17 timers, 2 watchdogs and RTC

- 19 timers: 2 16-bit advanced motor-control, 4 32-bit, 3 16-bit general purpose, 2 16-bit basic, 4 low-power 16-bit (available in Stop mode), 2 SysTick timers, and 2 watchdogs
- RTC with calendar, alarms, and calibration

Up to 25 communication peripherals

- 1 USB Type-C®/USB Power Delivery controller
- 1 USB OTG high-speed with embedded PHY
- 2 SAIs (serial-audio interface)
- 6 I2C FM+(1 Mbit/s), SMBus/PMBus®
- 7 USARTs (ISO 7816, LIN, IrDA, modem)
- 3 SPIs (5x SPIs with the dual OCTOSPI)
- 2 SDMMC interfaces
- 1 multifunction digital filter (6 filters) + 1 audio digital filter with sound-activity detection
- Parallel synchronous slave interface

16- and 4-channel DMA controllers, functional in Stop mode

Mathematical coprocessor

- CORDIC for trigonometric functions acceleration and FMAC

Up to 24 capacitive sensing channels

Rich analog peripherals (independent supply)

- 2 × 14-bit ADC 2.5-Msps with hardware oversampling
- 1 × 12-bit ADC 2.5-Msps, with hardware oversampling, autonomous in Stop 2 mode
- 12-bit DAC (2 channels), low-power sample and hold, autonomous in Stop 2 mode
- 2 operational amplifiers with built-in PGA
- 2 ultra-low-power comparators

CRC calculation unit

Debug

- Development support: serial-wire debug (SWD), JTAG, ETM

ECOPACK2 compliant packages

Table 1. Device summary

2 Description

The STM32U5Fxxx devices belong to an ultra-low-power microcontrollers family (STM32U5 Series) based on the high-performance Arm® Cortex®-M33 32-bit RISC core. They operate at a frequency of up to 160 MHz.

The Cortex®-M33 core features a single-precision FPU (floating-point unit), that supports all the Arm® single-precision data-processing instructions and all the data types.

The Cortex®-M33 core also implements a full set of DSP (digital signal processing) instructions and a MPU (memory protection unit) that enhances the application security.

The devices embed high-speed memories (up to 4 Mbytes of flash memory and 3 Mbytes of SRAM), an FSMC (flexible external memory controller) for static memories (for devices with packages of 100 pins and more), two Octo-SPI and one Hexadeca-SPI memory interfaces (at least one Quad-SPI available on all packages) and an extensive range of enhanced I/Os and peripherals connected to three APB buses, three AHB buses and a 32-bit multi-AHB bus matrix.

The devices offer security foundation compliant with the TBSA (trusted-based security architecture) requirements from Arm®. It embeds the necessary security features to implement a secure boot, secure data storage and secure firmware update. Besides these capabilities, the devices incorporate a secure firmware installation feature that allows the customer to secure the provisioning of the code during its production. A flexible life cycle is managed thanks to multiple levels of readout protection and debug unlock with password. Firmware hardware isolation is supported thanks to securable peripherals, memories and I/Os, and privilege configuration of peripherals and memories.

The devices feature several protection mechanisms for embedded flash memory and SRAM: readout protection, write protection, secure and hide protection areas.

The devices embed several peripherals reinforcing security: a HASH hardware accelerator, and a true random number generator.

The devices offer active tamper detection and protection against transient and environmental perturbation attacks, thanks to several internal monitoring generating secret data erase in case of attack. This helps to fit the PCI requirements for point of sales applications.

The devices offer two fast 14-bit ADCs (2.5 Msps), one 12-bit ADC (2.5 Msps), two comparators, two operational amplifiers, two DAC channels, an internal voltage reference buffer, a low-power RTC, four 32-bit general-purpose timers, two 16-bit PWM timers dedicated to motor control, three 16-bit general-purpose timers, two 16-bit basic timers and four 16-bit low-power timers.

The devices offer a rich set of graphic oriented peripherals: GPU2D (Neo-Chrom graphic processor) for graphic data fast processing including vector graphic operation, DMA2D (Chrom-ART Accelerator) for enhanced graphic content creation, GFXMMU (Chrom-GRC) allowing up to 20 % of graphic resources optimization, MIPI® DSI Host controller with two DSI lanes running at up to 500 Mbit/s each, and LTDC (LCD-TFT controller), a JPEG hardware compressor/decompressor and a dedicated GFXTIM graphic timer.

The devices support an MDF (multifunction digital filter) with six filters dedicated to the connection of external sigma-delta modulators. Another low-power digital filter dedicated to audio signals is embedded (ADF), with one filter supporting sound-activity detection. The

Downloaded from Arrow.com.

devices embed mathematical accelerators (a trigonometric functions accelerator plus a filter mathematical accelerator). In addition, up to 24 capacitive sensing channels are available.

The devices also feature standard and advanced communication interfaces such as: six I^2Cs, three SPIs, four USARTs, two UARTs and one low-power UART, two SAIs, one DCMI (digital camera interface), two SDMMCs, one USB OTG high-speed, one USB Type-C™/USB Power Delivery controller, and one generic synchronous 8-/16-bit PSSI (parallel data input/output slave interface).

The devices operate in the –40 to +85 °C (+ 105 °C junction) temperature ranges from a 1.71 to 3.6 V power supply.

A comprehensive set of power-saving modes allows the design of low-power applications. Many peripherals (including communication, analog, timers, and audio peripherals) can be functional and autonomous down to Stop mode with direct memory access, thanks to LPBAM support (low-power background autonomous mode).

Some independent power supplies are supported like an analog independent supply input for ADC, DACs, OPAMPs and comparators, a 3.3 V dedicated supply input for USB and up to 14 I/Os that can be supplied independently down to 1.08 V. A VBAT input is available for connecting a backup battery in order to preserve the RTC functionality and to backup 32 32-bit registers and 2-Kbyte SRAM.

The devices offer nine packages from 64 to 216 pins.

1. Two OCTOSPIs are available only in Muxed mode.
2. 8 bits only.
3. When both are used simultaneously, one supports only SDIO interface.
4. Supporting 4 channels only.
5. Even if not all LTDC signals can be mapped on GPIO AFs, the LTDC can be internally used to provide data to the DSI.
6. Active tampers in output sharing mode (one output shared by all inputs).

3 Functional overview

3.1 Arm Cortex-M33 core with TrustZone and FPU

The Cortex-M33 with TrustZone and FPU is a highly energy-efficient processor designed for microcontrollers and deeply embedded applications, especially those requiring efficient security.

The Cortex-M33 processor delivers a high computational performance with low-power consumption and an advanced response to interrupts. It features:

- Arm TrustZone technology, using the Armv8-M main extension supporting secure and nonsecure states
- MPUs (memory protection units), supporting up to 16 regions for secure and non-secure applications
- Configurable SAU (secure attribute unit) supporting up to eight memory regions as secure or nonsecure
- Floating-point arithmetic functionality with support for single precision arithmetic

The processor supports a set of DSP instructions that allows an efficient signal processing and a complex algorithm execution.

The Cortex-M33 processor supports the following bus interfaces:

- System AHB bus:

  The S-AHB (system AHB) bus interface is used for any instruction fetch and data access to the memory-mapped SRAM, peripheral, external RAM and external device, or Vendor_SYS regions of the Armv8-M memory map.
- Code AHB bus:

  The C-AHB (code AHB) bus interface is used for any instruction fetch and data access to the code region of the Armv8-M memory map.

Figure 1 shows the general block diagram of the STM32U5Fxxx devices.

3.2 ART Accelerator (ICACHE and DCACHE)

3.2.1 Instruction cache (ICACHE)

The ICACHE is introduced on C-AHB code bus of Cortex-M33 processor to improve performance when fetching instruction (or data) from both internal and external memories.

ICACHE offers the following features:

- Multi-bus interface:
  - Slave port receiving the memory requests from the Cortex-M33 C-AHB code execution port
  - Master1 port performing refill requests to internal memories (flash memory and SRAMs)
  - Master2 port performing refill requests to external memories (external flash memory and RAMs through Octo-SPI and FMC interfaces)
  - Second slave port dedicated to ICACHE registers access

Downloaded from Arrow.com.

- Close to zero wait-states instructions/data access performance:
  - 0 wait-state on cache hit
  - Hit-under-miss capability, allowing to serve new processor requests while a line refill (due to a previous cache miss) is still ongoing
  - Critical-word-first refill policy, minimizing processor stalls on cache miss
  - Hit ratio improved by two-ways set-associative architecture and pLRU-t replacement policy (pseudo-least-recently-used, based on binary tree), algorithm with best complexity/performance balance
  - Dual master ports allowing to decouple internal and external memory traffics, on fast and slow buses, respectively; also minimizing impact on interrupt latency
  - Optimal cache line refill thanks to AHB burst transactions (of the cache line size)
  - Performance monitoring by means of a hit counter and a miss counter
- Extension of cacheable region beyond the code memory space, by means of address remapping logic that allows four cacheable external regions to be defined
- Power consumption reduced intrinsically (more accesses to cache memory rather to bigger main memories); even improved by configuring ICACHE as direct mapped (rather than the default two-ways set-associative mode)
- TrustZone security support
- Maintenance operation for software management of cache coherency
- Error management: detection of unexpected cacheable write access, with optional interrupt raising

3.2.2 Data cache (DCACHE)

The DCACHE is introduced on S-AHB system bus of Cortex-M33 processor to improve the performance of data traffic to/from external memories.

DCACHE offers the following features:

- Multi-bus interface:
  - Slave port receiving the memory requests from the Cortex-M33 S-AHB system port
  - Master port performing refill requests to external memories (external flash memory and RAMs through Octo-SPI and FMC interfaces)
  - Second slave port dedicated to DCACHE registers access
- Close to zero wait-states external data access performance:
  - Zero wait-states on cache hit
  - Hit-under-miss capability, allowing to serve new processor requests to cached data, while a line refill (due to a previous cache miss) is still ongoing
  - Critical-word-first refill policy for read transactions, minimizing processor stalls on cache miss
  - Hit ratio improved by two-ways set-associative architecture and pLRU-t replacement policy (pseudo-least-recently-used, based on binary tree), algorithm with best complexity/performance balance
  - Optimal cache line refill thanks to AHB burst transactions (of the cache line size)
  - Performance monitoring by means of two hit counters (for read and write) and two miss counters (for read and write)

Downloaded from Arrow.com.

- Supported cache accesses:
  - Both write-back and write-through policies supported (selectable with AHB bufferable attribute)
  - Read and write-back always allocated
  - Write-through always non-allocated (write-around)
  - Byte, half-word and word writes supported
- TrustZone security support
- Maintenance operations for software management of cache coherency:
  - Full cache invalidation (non interruptible)
  - Address range clean and/or invalidate operations (background task, interruptible)
- Error management: detection of error for master port request initiated by DCACHE (line eviction or clean operation), with optional interrupt raising

3.3 Memory protection unit

The MPU (memory protection unit) is used to manage the CPU accesses to the memory and to prevent one task to accidentally corrupt the memory or the resources used by any other active task. This memory area is organized into up to 16 protected areas.
The MPU regions and registers are banked across secure and nonsecure states.

The MPU is especially helpful for applications where some critical or certified code must be protected against the misbehavior of other tasks. It is usually managed by a RTOS (real-time operating system).

If a program accesses a memory location that is prohibited by the MPU, the RTOS can detect it and take action. In a RTOS environment, the kernel can dynamically update the MPU area setting based on the process to be executed.

The MPU is optional and can be bypassed for applications that do not need it.

3.4 Embedded flash memory

The devices feature 4 Mbytes of embedded flash memory that is available for storing programs and data. The flash memory supports 10 000 cycles and up to 100 000 cycles on 512 Kbytes. A 128-bit instruction prefetch is implemented and can optionally be enabled.

The flash memory interface features:

- Dual-bank operating modes
- Read-while-write (RWW)

This allows a read operation to be performed from one bank while an erase or program operation is performed to the other bank. The dual-bank boot is also supported. Each bank contains 256 pages of 8 Kbytes. The flash memory also embeds 512-byte OTP (one-time programmable) for user data.

The whole non-volatile memory embeds the ECC (error correction code) feature supporting:

- single-error detection and correction
- double-error detection
- ECC fail address report

Downloaded from Arrow.com.

Flash memory protection

The option bytes allow the configuration of flexible protections:

- write protection (WRP) to protect areas against erasing and programming. Two areas per bank can be selected with 8-Kbyte granularity.
- RDP (readout protection) to protect the whole memory, has four levels of protection available (see *Table 3* and *Table 4*):
  - Level 0: no readout protection
  - Level 0.5: available only when TrustZone is enabled

    All read/write operations (if no write protection is set) from/to the nonsecure flash memory are possible. The debug access to secure area is prohibited.
    Debug access to nonsecure area remains possible.
  - Level 1: memory readout protection

    The flash memory cannot be read from or written to if either the debug features are connected or the boot in RAM or bootloader are selected. If TrustZone is enabled, the nonsecure debug is possible and the boot in SRAM is not possible. Regressions from Level 1 to lower levels can be protected by password authentication.
  - Level 2: chip readout protection

    The debug features, the boot in RAM and the bootloader selection are disabled. A secure secret key can be configured in the secure options to allow the regression capability from Level 2 to Level 1. By default (key not configured), this Level 2 selection is irreversible and JTAG/SWD interfaces are disabled. If the secret key was previously configured in lower RDP levels, the device enables the RDP regression from Level 2 to Level 1 after password authentication through JTAG/SWD interface.

Note: In order to reach the best protection level, it is recommended to activate TrustZone and to set the RDP Level 2 with password authentication regression enabled.

Table 3. Access status versus protection level and execution modes when TZEN = 0

Area	RDP level	User execution (boot from flash memory)			Debug/boot from RAM/ bootloader(1)		
		Read	Write	Erase	Read	Write	Erase
Flash main memory	1	Yes	Yes	Yes	No	No	No(4)
	2	Yes	Yes	Yes	N/A	N/A	N/A
System memory (2)	1	Yes	No	No	Yes	No	No
	2	Yes	No	No	N/A	N/A	N/A
Option bytes(3)	1	Yes	Yes(4)	N/A	Yes	Yes(4)	N/A
	2	Yes	No(5)	N/A	N/A	N/A	N/A

Table 3. Access status versus protection level and execution modes when TZEN = 0 (continued)

Area	RDP level	User execution (boot from flash memory)			Debug/boot from RAM/ bootloader(1)		
		Read	Write	Erase	Read	Write	Erase
Backup registers	1	Yes	Yes	N/A	No	No	N/A(7)
	2	Yes	Yes	N/A	N/A	N/A	N/A
SRAM2/backup RAM	1	Yes	Yes	N/A	No	No	N/A(8)
	2	Yes	Yes	N/A	N/A	N/A	N/A

1. When the protection level 2 is active, the debug port, the boot from RAM and the boot from system memory are disabled.
2. The system memory is only read-accessible, whatever the protection level (0, 1 or 2) and execution mode.
3. Option bytes are only accessible through the flash memory registers and OPSTRT bit.
4. The flash main memory is erased when the RDP option byte changes from level 1 to level 0.
5. SWAP_BANK option bit can be modified.
6. OTP can only be written once.
7. The backup registers are erased when RDP changes from level 1 to level 0.
8. All SRAMs are erased when RDP changes from level 1 to level 0.

Table 4. Access status versus protection level and execution modes when TZEN = 1

Area	RDP level	User execution (boot from flash memory)			Debug/ bootloader(1)		
		Read	Write	Erase	Read	Write	Erase
Flash main memory	0.5	Yes	Yes	Yes	Yes(2)	Yes(2)	Yes(2)
	1	Yes	Yes	Yes	No	No	No(5)
	2	Yes	Yes	Yes	N/A	N/A	N/A
System memory (3)	0.5	Yes	No	No	Yes	No	No
	1	Yes	No	No	Yes	No	No
	2	Yes	No	No	N/A	N/A	N/A
Option bytes(4)	0.5	Yes	Yes(5)	N/A	Yes	Yes (5)	N/A
	1	Yes	Yes(5)	N/A	Yes	Yes(5)	N/A
	2	Yes	No(6)	N/A	N/A	N/A	N/A
OTP	0.5	Yes	Yes(7)	N/A	Yes	Yes(7)	N/A
	1	Yes	Yes(7)	N/A	Yes	Yes(7)	N/A
	2	Yes	Yes(7)	N/A	N/A	N/A	N/A

Downloaded from Arrow.com.

Table 4. Access status versus protection level and execution modes when TZEN = 1 (continued)

Area	RDP level	User execution (boot from flash memory)			Debug/ bootloader(1)		
		Read	Write	Erase	Read	Write	Erase
Backup registers	0.5	Yes	Yes	N/A	Yes(2)	Yes(2)	N/A(8)
	1	Yes	Yes	N/A	No	No	N/A(8)
	2	Yes	Yes	N/A	N/A	N/A	N/A
SRAM2/backup RAM	0.5	Yes	Yes	N/A	Yes(2)	Yes(2)	N/A(9)
	1	Yes	Yes	N/A	No	No	N/A(9)
	2	Yes	Yes	N/A	N/A	N/A	N/A

1. When the protection level 2 is active, the debug port and the bootloader mode are disabled.
2. Depends on TrustZone security access rights.
3. The system memory is only read-accessible, whatever the protection level (0, 1 or 2) and execution mode.
4. Option bytes are only accessible through the flash memory registers and OPSTRT bit.
5. The flash main memory is erased when the RDP option byte regresses from level 1 to level 0.
6. SWAP_BANK option bit can be modified.
7. OTP can only be written once.
8. The backup registers are erased when RDP changes from level 1 to level 0.
9. All SRAMs are erased when RDP changes from level 1 to level 0.

3.4.1 Additional flash memory protections when TrustZone activated

When the TrustZone security is enabled through option bytes, the whole flash memory is secure after reset and the following protections are available:

- non-volatile watermark-based secure flash memory area

  The secure area can be accessed only in Secure mode. One area per bank can be selected with a page granularity.
- secure HDP (hide protection area)

  It is part of the flash memory secure area and can be protected to deny an access to this area by any data read, write and instruction fetch. For example, a software code in the secure flash memory hide protection area can be executed only once and deny any further access to this area until next system reset. One area per bank can be selected at the beginning of the secure area.
- volatile block-based secure flash memory area

  Each page can be programmed on-the-fly as secure or nonsecure.

3.4.2 FLASH privilege protection

Each flash memory page can be programmed on the fly as privileged or unprivileged.

Downloaded from Arrow.com.

3.5 Embedded SRAMs

Seven SRAMs are embedded in the STM32U5Fxxx devices, each with specific features. SRAM1, SRAM2, SRAM3, SRAM5, and SRAM6 are the main SRAMs. SRAM4 is in the SRAM used for peripherals LPBAM (low-power background autonomous mode) in Stop 2 mode.

These SRAMs are made of several blocks that can be powered down in Stop mode to reduce consumption:

- SRAM1: 12 64-Kbyte blocks (total 768 Kbytes)
- SRAM2: 8-Kbyte + 56-Kbyte blocks (total 64 Kbytes) with optional ECC. In addition SRAM2 blocks can be retained in Standby mode.
- SRAM3: 13 64-Kbyte blocks (total 832 Kbytes) with optional ECC. When ECC is enabled, 256 Kbytes support ECC and 512 Kbytes of SRAM3 can be accessed without ECC.
- SRAM4: 16 Kbytes
- SRAM5: 13 64-Kbyte blocks (total 832 Kbytes)
- SRAM6: 8 64-Kbyte blocks (total 512 Kbytes)
- BKPSRAM (backup SRAM): 2 Kbytes with optional ECC. The BKPSRAM can be retained in all low-power modes and when V_{DD} is off in V_{BAT} mode, but not in Shutdown mode.

3.5.1 SRAMs TrustZone security

When the TrustZone security is enabled, all SRAMs are secure after reset. The SRAM1, SRAM2, SRAM3, SRAM4, SRAM5, and SRAM6 can be programmed as secure or nonsecure by blocks, using the MPCBB (block-based memory protection controller).

The granularity of SRAM secure block based is a page of 512 bytes. Backup SRAM regions can be programmed as secure or nonsecure with watermark, using the TZSC (TrustZone security controller) in the GTZC (global TrustZone controller).

3.5.2 SRAMs privilege protection

The SRAM1, SRAM2, SRAM3, SRAM4, SRAM5, and SRAM6 can be programmed as privileged or unprivileged by blocks, using the MPCBB. The granularity of SRAM privilege block based is a page of 512 bytes. Backup SRAM regions can be programmed as privileged or unprivileged with watermark, using the TZSC (TrustZone security controller) in the GTZC (global TrustZone controller).

3.6 TrustZone security architecture

The security architecture is based on Arm TrustZone with the Armv8-M main extension.

The TrustZone security is activated by the TZEN option bit in the FLASH_OPTR register.

Downloaded from Arrow.com.

When the TrustZone is enabled, the SAU (security attribution unit) and IDAU (implementation defined attribution unit) define the access permissions based on secure and nonsecure state.

- SAU: up to eight SAU configurable regions are available for security attribution.
- IDAU: It provides a first memory partition as nonsecure or nonsecure callable attributes. It is then combined with the results from the SAU security attribution and the higher security state is selected.

Based on IDAU security attribution, the flash memory, system SRAM and peripheral memory space is aliased twice for secure and nonsecure states. However, the external memory space is not aliased.

The table below shows an example of typical SAU region configuration based on IDAU regions. The user can split and choose the secure, nonsecure or NSC regions for external memories as needed.

Table 5. Example of memory map security attribution versus SAU configuration regions

Region description	Address range	IDAU security attribution	SAU security attribution typical configuration	Final security attribution
Code - external memories	0x0000 0000 0x07FF FFFF	Nonsecure	Secure or nonsecure or NSC(1)	Secure or nonsecure or NSC
Code - FLASH and SRAM	0x0800 0000 0x0BFF FFFF	Nonsecure	Nonsecure	Nonsecure
	0x0C00 0000 0x0FFF FFFF	NSC	Secure or NSC	Secure or NSC
Code - external memories	0x1000 0000 0x17FF FFFF	Nonsecure	Nonsecure	
	0x1800 0000 0x1FFF FFFF			
SRAM	0x2000 0000 0x2FFF FFFF	Nonsecure		
	0x3000 0000 0x3FFF FFFF	NSC	Secure or NSC	Secure or NSC
Peripherals	0x4000 0000 0x4FFF FFFF	Nonsecure	Nonsecure	Nonsecure
	0x5000 0000 0x5FFF FFFF	NSC	Secure or NSC	Secure or NSC
External memories	0x6000 0000 0xDFFF FFFF	Nonsecure	Secure or nonsecure or NSC	Secure or nonsecure or NSC

1. NSC = nonsecure callable.

Downloaded from Arrow.com.

3.6.1 TrustZone peripheral classification

When the TrustZone security is active, a peripheral can be either securable or TrustZone-aware type as follows:

- securable: peripheral protected by an AHB/APB firewall gate that is controlled from TZSC to define security properties
- TrustZone-aware: peripheral connected directly to AHB or APB bus and implementing a specific TrustZone behavior such as a subset of registers being secure

3.6.2 Default TrustZone security state

The default system security state is detailed below:

- CPU:
  - Cortex-M33 is in secure state after reset. The boot address must be in secure address.
- Memory map:
  - SAU is fully secure after reset. Consequently, all memory map is fully secure. Up to eight SAU configurable regions are available for security attribution.
- Flash memory:
  - Flash memory security area is defined by watermark user options.
  - Flash memory block based area is nonsecure after reset.
- SRAMs:
  - All SRAMs are secure after reset. MPCBB (memory protection block based controller) is secure.
- External memories:
  - FSMC, OCTOSPI banks are secure after reset. MPCWMx (memory protection watermark based controller) is secure.
- Peripherals
  - Securable peripherals are nonsecure after reset.
  - TrustZone-aware peripherals are nonsecure after reset. Their secure configuration registers are secure.
- All GPIOs are secure after reset.
- Interrupts:
  - NVIC: All interrupts are secure after reset. NVIC is banked for secure and nonsecure state.
- TZIC: All illegal access interrupts are disabled after reset.

3.7 Boot modes

At startup, a BOOT0 pin, nBOOT0, NSBOOTADDx[24:0] (x = 0,1) and SECBOOTADD0[24:0] option bytes are used to select the boot memory address that includes:

- Boot from any address in user flash memory.
- Boot from system memory bootloader.
- Boot from any address in embedded SRAM.
- Boot from RSS (root security services).

Downloaded from Arrow.com.

The BOOT0 value comes from the PH3-BOOT0 pin or from an option bit depending on the value of a user option bit to free the GPIO pad if needed.

The bootloader is located in the system memory, programmed by ST during production. The bootloader is used to reprogram the flash memory by using USART, I2C, SPI, or USB HS in device mode through the DFU (device firmware upgrade).

The bootloader is available on all devices. Refer to the application note *STM32 microcontroller system memory boot mode* (AN2606) for more details.

The RSS are embedded in a flash memory area named secure information block, programmed during ST production.

For example, the RSS enable the SFI (secure firmware installation), thanks to the RSSe SFI (RSS extension firmware).

This feature allows customer to produce the confidentiality of the firmware to be provisioned into the STM32, when production is sub-contracted to untrusted third party.

The RSS are available on all devices, after enabling the TrustZone through the TZEN option bit. Refer to the application note *Overview secure firmware install* (SFI) (AN4992) for more details.

Refer to *Table 6* and *Table 7* for boot modes when TrustZone is disabled and enabled respectively.

Table 6. Boot modes when TrustZone is disabled (TZEN = 0)

nBOOT0 FLASH_ OPTR[27]	BOOT0 pin PH3	nSWBOOT0 FLASH_ OPTR[26]	Boot address option-byte selection	Boot area	ST programmed default value
-	0	1	NSBOOTADD0[24:0]	Boot address defined by user option bytes NSBOOTADD0[24:0]	Flash: 0x0800 0000
-	1	1	NSBOOTADD1[24:0]	Boot address defined by user option bytes NSBOOTADD1[24:0]	Bootloader: 0x0BF9 0000
1	-	0	NSBOOTADD0[24:0]	Boot address defined by user option bytes NSBOOTADD0[24:0]	Flash: 0x0800 0000
0	-	0	NSBOOTADD1[24:0]	Boot address defined by user option bytes NSBOOTADD1[24:0]	Bootloader: 0x0BF9 0000

When TrustZone is enabled by setting the TZEN option bit, the boot space must be in the secure area. The SECBOOTADD0[24:0] option bytes are used to select the boot secure memory address.

A unique boot entry option can be selected by setting the BOOT_LOCK option bit, allowing to boot always at the address selected by SECBOOTADD0[24:0] option bytes. All other boot options are ignored.

Downloaded from Arrow.com.

Table 7. Boot modes when TrustZone is enabled (TZEN = 1)

BOOT_ LOCK	nBOOT0 FLASH_ OPTR[27]	BOOT0 pin PH3	nSWBOOT0 FLASH_ OPTR[26]	RSS com-mand	Boot address option-byte selection	Boot area	ST programmed default value
0	-	0	1	0	SECBOOTADD0 [24:0]	Secure boot address defined by user option bytes SECBOOTADD0[24:0]	Flash: 0x0C00 0000
	-	1	1	0	N/A	RSS	RSS: 0x0FF8 0000
	1	-	0	0	SECBOOTADD0 [24:0]	Secure boot address defined by user option bytes SECBOOTADD0[24:0]	Flash: 0x0C00 0000
	0	-	0	0	N/A	RSS	RSS: 0x0FF8 0000
	-	-	-	≠0	N/A	RSS	RSS: 0x0FF8 0000
1	-	-	-	-	SECBOOTADD0 [24:0]	Secure boot address defined by user option bytes SECBOOTADD0[24:0]	Flash: 0x0C00 0000

The boot address option bytes allow any boot memory address to be programmed. However, the allowed address space depends on the flash memory RDP level.

If the programmed boot memory address is out of the allowed memory mapped area when RDP level is 0.5 or more, the default boot address is forced either in secure flash memory or nonsecure flash memory, depending on TrustZone security option as described in the table below.

Table 8. Boot space versus RDP protection

RDP	TZEN = 1	TZEN = 0
0	Any boot address	Any boot address
0.5	Boot address only in RSS or secure flash memory: 0x0C00 0000 - 0x0C3F FFFF Otherwise, forced boot address is 0x0FF8 0000.	N/A
1		Any boot address
2		Boot address only in flash memory: 0x0800 0000 - 0x083F FFFF Otherwise, forced boot address is 0x0800 0000.

Downloaded from Arrow.com.

3.8 Global TrustZone controller (GTZC)

GTZC is used to configure TrustZone and privileged attributes within the full system.

The GTZC includes three different sub-blocks:

- TZSC: TrustZone security controller

  This sub-block defines the secure/privilege state of slave/master peripherals. It also controls the nonsecure area size for the watermark memory peripheral controller (MPCWM). The TZSC block informs some peripherals (such as RCC or GPIOs) about the secure status of each securable peripheral, by sharing with RCC and I/O logic.
- TZIC: TrustZone illegal access controller

  This sub-block gathers all security illegal access events in the system and generates a secure interrupt towards NVIC.
- MPCBB: MPCBB: block-based memory protection controller

  This sub-block controls secure states of all memory blocks (512-byte pages) of the associated SRAM. This peripheral aims at configuring the internal RAM in a TrustZone system product having segmented SRAM with programmable-security and privileged attributes.

The GTZC main features are:

- Three independent 32-bit AHB interfaces for TZSC, TZIC and MPCBB
- Secure and nonsecure access supported for privileged/unprivileged part of TZSC
- Set of registers to define product security settings:
  - Secure/privilege regions for external memories
  - Secure/privilege access mode for securable peripherals
  - Secure/privilege access mode for securable legacy masters

3.9 Power supply management

The PWR (power controller) main features are:

- Power supplies and supply domains
  - Core domain (V_{CORE})
  - V_{DD} domain
  - Backup domain (V_{BAT})
  - Analog domain (V_{DDA})
  - SMPS power stage (V_{DDSMPS}, available only on SMPS packages)
  - V_{DDIO2} domain
  - V_{DDUSB} and optional $V_{DD11USB}$ for USB transceiver
  - V_{DDDSI} and $V_{DD11DSI}$ for DSI transceiver
- System supply voltage regulation
  - SMPS step down converter
  - Voltage regulator (LDO)

Downloaded from Arrow.com.

- Power supply supervision
  - BOR monitor
  - PVD monitor
  - PVM monitor (V_{DDA}, V_{DDUSB}, V_{DDIO2})
- Power management
  - Operating modes
  - Voltage scaling control
  - Low-power modes
- V_{BAT} battery charging
- TrustZone security and privileged protection

3.9.1 Power supply schemes

The devices require a 1.71 V to 3.6 V V_{DD} operating voltage supply. Several independent supplies can be provided for specific peripherals:

- V_{DD} = 1.71 V to 3.6 V (functionality guaranteed down to V_{BORx} min value)

  V_{DD} is the external power supply for the I/Os, the internal regulator and the system analog such as reset, power management and internal clocks. It is provided externally through the VDD pins.
- V_{DDA} = 1.58 V (COMPs) / 1.6 V (DACs, OPAMPs) / 1.62 V (ADCs) / 1.8 V (VREFBUF) to 3.6 V

  V_{DDA} is the external analog power supply for ADCs, DACs, voltage reference buffer, operational amplifiers and comparators. The V_{DDA} voltage level is independent from the V_{DD} voltage and must be connected to VDD or VSS pin (preferably to VDD) when these peripherals are not used.
- V_{DDSMPS} = 1.71 V to 3.6 V

  V_{DDSMPS} is the external power supply for the SMPS step down converter. It is provided externally through VDDSMPS supply pin and must be connected to the same supply than VDD.
- V_{LXSMPS} is the switched SMPS step down converter output.

Note: The SMPS power supply pins are available only on a specific package with SMPS step down converter option.

- V_{DDUSB} = 3.0 V to 3.6 V

  V_{DDUSB} is the external independent power supply for USB transceivers. V_{DDUSB} voltage level is independent from the V_{DD} voltage and must be connected to VDD or VSS pin (preferably to VDD) when the USB is not used.
- $V_{DD11USB}$ = 1.0 V to 1.26 V

  $V_{DD11USB}$ is the external power supply for the USB transceiver. This supply is only available on specific packages and must be connected to VDD11.
- V_{DDIO2} = 1.08 V to 3.6 V

  V_{DDIO2} is the external power supply for 14 I/Os (port G[15:2]). The V_{DDIO2} voltage level is independent from the V_{DD} voltage and must be connected to VDD or VSS pin (preferably to VDD) when PG[15:2] are not used.
- V_{BAT} = 1.65 V to 3.6 V (functionality guaranteed down to V_{BOR_VBAT} min value)

  V_{BAT} is the power supply for RTC, TAMP, external clock 32 kHz oscillator and backup registers (through power switch) when V_{DD} is not present.

Downloaded from Arrow.com.

- V_{DDDSI} = 1.71 V to 3.6 V

  V_{DDDSI} is the external power supply for the DSI controller. It is provided externally through VDDDSI supply pin, and must be connected to the same supply as VDD pin.

- $V_{DD11DSI}$ = 1.0 V to 1.26 V

  $V_{DD11DSI}$ is the external power supply for the DSI transceiver and must be connected to VDD11.

- V_{REF-}, V_{REF+}

  V_{REF+} is the input reference voltage for ADCs and DACs. It is also the output of the internal voltage reference buffer when enabled.

  V_{REF+} can be grounded when ADC and DAC are not active.

  The internal voltage reference buffer supports four outputs:

  – V_{REF+} around 1.5 V. This requires $V_{DDA} \geq 1.8$ V.
  – V_{REF+} around 1.8 V. This requires $V_{DDA} \geq 2.1$ V.
  – V_{REF+} around 2.048 V. This requires $V_{DDA} \geq 2.4$ V.
  – V_{REF+} around 2.5 V. This requires $V_{DDA} \geq 2.8$ V.

  VREF- and VREF+ pins are not available on all packages. When not available, they are bonded to VSSA and VDDA, respectively.

  When the VREF+ is double-bonded with VDDA in a package, the internal voltage reference buffer is not available and must be kept disabled.

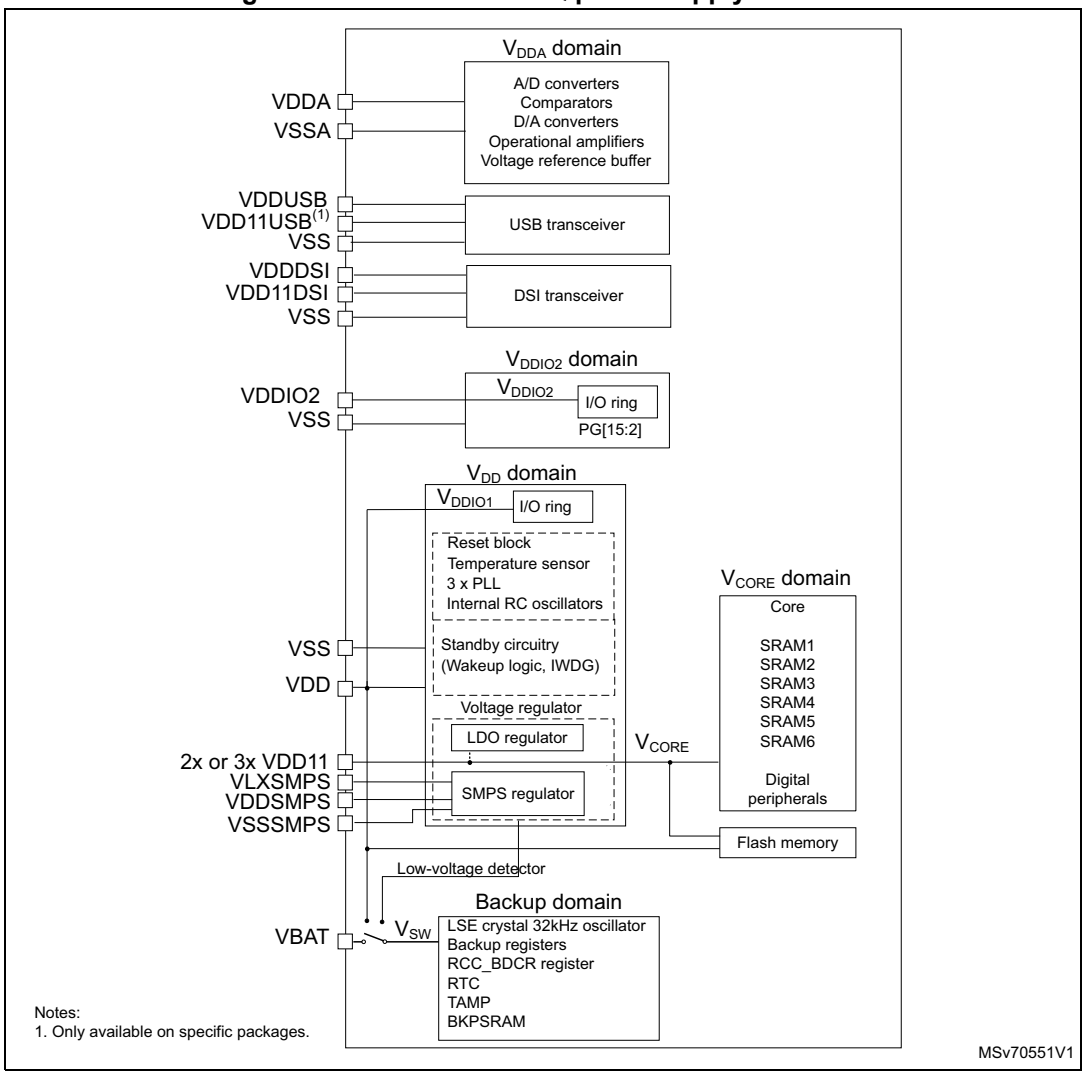
  V_{REF-} must always be equal to V_{SSA}.

The STM32U5Fxxx devices embed two regulators: one LDO and one SMPS in parallel to provide the V_{CORE} supply for digital peripherals, SRAM1, SRAM2, SRAM3, SRAM4, SRAM5, SRAM6, and embedded flash memory. The SMPS and LDO generates this voltage on VDD11 (two or three pins) with a total external capacitor of 4.7 µF typical. SMPS requires an external coil of 2.2 µH typical.

Both regulators can provide four different voltages (voltage scaling) and can operate in Stop modes.

Downloaded from Arrow.com.

Figure 2. STM32U5FxxxxxQ power supply overview



In this document, V_{DDIOx} refers to the I/O power supply. V_{DDIOx} can be V_{DDIO1} (which is supplied by V_{DD}), V_{DDIO2} (independent power supply for PG[15:2]), or V_{SW} (supplying PC13, PC14, PC15, and all FT_t I/Os in VBAT mode).

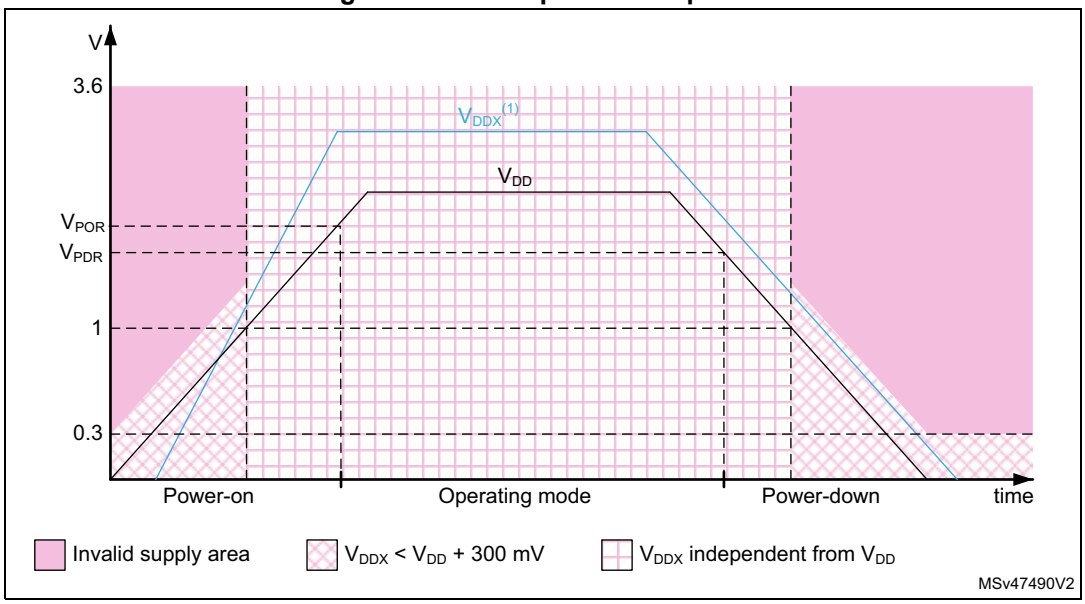
$V_{SW} = V_{DD}$ when V_{DD} is above V_{BOR0}, and $V_{SW} = V_{BAT}$ when V_{DD} is below V_{BOR0}.

During power-up and power-down phases, the following power sequence requirements must be respected:

- When V_{DD} is below 1 V, other power supplies (V_{DDA}, V_{DDIO2}, V_{DDUSB}) must remain below V_{DD} + 300 mV.
- When V_{DD} is above 1 V, all power supplies are independent.
- During the power-down phase, V_{DD} can temporarily become lower than other supplies only if the energy provided to the MCU remains below 1 mJ. This allows external decoupling capacitors to be discharged with different time constants during the power-down transient phase.

Downloaded from Arrow.com.

Figure 3. Power-up /down sequence



1. V_{DDX} refers to any power supply among V_{DDA}, V_{DDUSB}, and V_{DDIO2}.

3.9.2 Power supply supervisor

The devices have an integrated ultra-low-power BOR (Brownout reset) active in all modes (except for Shutdown mode). The BOR ensures proper operation of the device after power on and during power down. The device remains in reset mode when the monitored supply voltage V_{DD} is below a specified threshold, without the need for an external reset circuit.

The lowest BOR level is 1.71 V at power on, and other higher thresholds can be selected through option bytes.The devices feature an embedded PVD (programmable voltage detector) that monitors the V_{DD} power supply and compares it to the V_{PVD} threshold.

An interrupt can be generated when V_{DD} drops below and/or rises above the V_{PVD} threshold. The interrupt service routine can then generate a warning message and/or put the MCU into a safe state. The PVD is enabled by software.

In addition, the devices embed a peripheral voltage monitor that compares the independent supply voltages V_{DDA}, V_{DDUSB} and V_{DDIO2} to ensure that the peripheral is in its functional supply range.

The devices support dynamic voltage scaling to optimize its power consumption in Run mode. The voltage from the main regulator that supplies the logic (V_{CORE}) can be adjusted according to the system's maximum operating frequency.

The main regulator operates in the following ranges:

- Range 1 (V_{CORE} = 1.2 V) with CPU and peripherals running at up to 160 MHz
- Range 2 (V_{CORE} = 1.1 V) with CPU and peripherals running at up to 110 MHz
- Range 3 (V_{CORE} = 1.0 V) with CPU and peripherals running at up to 55 MHz
- Range 4 (V_{CORE} = 0.9 V) with CPU and peripherals running at up to 25 MHz

Downloaded from Arrow.com.

3.9.3 Low-power modes

The ultra-low-power STM32U5Fxxx devices support seven low-power modes to achieve the best compromise between low-power consumption, short startup time, available peripherals and available wake-up sources.

The table below details the related low-power modes.

Table 9. STM32U5Fxxx modes overview

Mode	Regulator (1)	CPU	Flash	SRAM	Clocks	DMA and peripherals(2)	Wake-up source
Run	Range 1	Yes	ON(3)	ON	Any	All	N/A

Downloaded from Arrow.com.

1. LPR means that the main regulator is OFF and the low-power regulator is ON.
2. All peripherals can be active or clock gated to save power consumption.
3. The flash memory can be put in power-down and its clock can be gated off when executing from SRAM. One bank can also be put in power-down mode.
4. The SRAM1, SRAM2, SRAM3, SRAM4, SRAM5, SRAM6 and BKPSRAM clocks can be gated on or off independently.
5. The SRAM can be individually powered off to save power consumption.
6. MSI and HSI16 can be temporary enabled upon peripheral request, for autonomous functions with DMA or wake-up from Stop event detections.
7. The ADC4 conversion is functional and autonomous with DMA in Stop mode, and can generate a wake-up interrupt on conversion events.
8. DAC1 is the digital-to-analog (D/A) converter controller instance name. This instance controls two D/A converters also called "two channels". The DAC conversions are functional and autonomous with DMA in Stop mode.
9. U(S)ART and LPUART transmission and reception is functional and autonomous with DMA in Stop mode, and can generate a wake-up interrupt on transfer events.
10. SPI transmission and reception is functional and autonomous with DMA in Stop mode, and can generate a wake-up interrupt on transfer events.
11. I2C transmission and reception is functional and autonomous with DMA in Stop mode, and can generate a wake-up interrupt on transfer events.
12. LPTIM is functional and autonomous with DMA in Stop mode, and can generate a wake-up interrupt on all events.
13. MDF and ADF are functional and autonomous with DMA in Stop mode, and can generate a wake-up interrupt on events.
14. GPDMA and LPDMA are functional and autonomous in Stop mode, and can generate a wake-up interrupt on events.
15. I/Os can be configured with internal pull-up, pull-down or floating in Shutdown mode but the configuration is lost when exiting the Shutdown mode.

By default, the microcontroller is in Run mode after a system or a power reset. It is up to the user to select one of the low-power modes described below:

- **Sleep** mode

  In Sleep mode, only the CPU is stopped. All peripherals continue to operate and can wake up the CPU when an interrupt/event occurs.

- **Stop 0, Stop 1, Stop 2 and Stop 3** modes

  Stop mode achieves the lowest power consumption while retaining the content of SRAM and registers. The SRAMs can be totally or partially switched off to further reduce consumption. All clocks in the V_{CORE} domain are stopped, the PLL, the MSI, the HSI16, the HSI48 and the HSE crystal oscillators are disabled. The LSE or LSI is still running.

  The RTC can remain active (Stop mode with RTC, Stop mode without RTC).

  Some peripherals are autonomous and can operate in Stop mode by requesting their kernel clock and their bus (APB or AHB) when needed, in order to transfer data with DMA (GPDMA1 in Stop 0 and Stop 1 modes, LPDMA1 in Stop 0, Stop 1 and Stop 2 modes). Refer to *Low-power background autonomous mode (LPBAM)* for more details. LPBAM is not supported in Stop 3 mode.

  In Stop 2 and Stop 3 modes, most of the V_{CORE} domain is put in a lower leakage mode. Stop 0 and Stop 1 modes offer the largest number of active peripherals and wake-up sources, a smaller wake-up time but a higher consumption than Stop 2 mode.

  In Stop 0 mode, the main regulator remains ON, allowing a very fast wake-up time but with much higher consumption.

  Stop 3 is the lowest power mode with full retention, but the functional peripherals and wake-up sources are reduced to the same ones than in Standby mode.

  The system clock when exiting from Stop 0, Stop 1 or Stop 2 mode can be either MSI up to 24 MHz or HSI16, depending on software configuration.

Downloaded from Arrow.com.

- **Standby** mode

  The Standby mode is used to achieve the lowest power consumption with BOR. The internal regulator is switched off so that the V_{CORE} domain is powered off. The PLL, the MSI, the HSI16, the HSI48 and the HSE crystal oscillators are also switched off.

  The RTC can remain active (Standby mode with RTC, Standby mode without RTC).

  The BOR always remains active in Standby mode.

  The state of each I/O during Standby mode can be selected by software: I/O with internal pull-up, internal pull-down or floating.

  After entering Standby mode, SRAMs and register contents are lost except for registers and backup SRAM in the Backup domain and Standby circuitry. Optionally, the full SRAM2 or 8 Kbytes or 56 Kbytes can be retained in Standby mode, supplied by the low-power regulator (Standby with SRAM2 retention mode).

  The BOR can be configured in ultra-low-power mode to further reduce power consumption during Standby mode.

  The device exits Standby mode when an external reset (NRST pin), an IWDG reset, WKUP pin event (configurable rising or falling edge), an RTC event occurs (alarm, periodic wake-up, timestamp), or a tamper detection. The tamper detection can be raised either due to external pins or due to an internal failure detection.

  The system clock after wake-up is MSI up to 4 MHz.

- **Shutdown** mode

  The lowest power consumption is achieved in Shutdown mode. The internal regulator is switched off so that the V_{CORE} domain is powered off. The PLL, the HSI16, the HSI48, the MSI, the LSI and the HSE oscillators are also switched off.

  The RTC can remain active (Shutdown mode with RTC, Shutdown mode without RTC). The BOR is not available in Shutdown mode. No power voltage monitoring is possible in this mode, therefore the switch to backup domain is not supported (V_{BAT} mode is not supported).

  SRAMs and register contents are lost except for registers in the backup domain as long as VDD is present.

  The device exits Shutdown mode when an external reset (NRST pin), a WKUP pin event (configurable rising or falling edge), or an RTC event occurs (alarm, periodic wake-up, timestamp), or a tamper detection.

  The system clock after wake-up is MSI at 4 MHz.

Low-power background autonomous mode (LPBAM)

The ultra-low-power STM32U5Fxxx devices support LPBAM (low-power background autonomous mode) that allows peripherals to be functional and autonomous in Stop mode (Stop 0, Stop 1 and Stop 2 modes), so without any software running.

In Stop 0 and Stop 1 modes, the autonomous peripherals are the following: ADC4, DAC1, LPTIMx (x = 1 to 4), USARTx (x = 1 to 6), LPUART1, SPIx (x = 1 to 3), I2Cx (x = 1 to 6), MDF1, ADF1, GPDMA1 and LPDMA1. In these modes, SRAM1, SRAM2, SRAM3, SRAM4 SRAM5, and SRAM6 can be accessed by the GPDMA1, and SRAM4 can be accessed by the LPDMA1.

In Stop 2 mode, the autonomous peripherals are the following: ADC4, DAC1, LPTIM1, LPTIM3, LPTIM4, LPUART1, SPI3, I2C3, ADF1 and LPDMA1. In this mode, the SRAM4 can be accessed by the LPDMA1.

Downloaded from Arrow.com.

Those peripherals support the features detailed below:

- Functionality in Stop mode thanks to its own independent clock (named kernel clock) request capability: the peripheral kernel clock is automatically switched on when requested by a peripheral, and automatically switched off when no peripheral requests it.
- DMA transfers supported in Stop mode thanks to system clock request capability: the system clock (MSI or HSI16) automatically switched on when requested by a peripheral, and automatically switched off when no peripheral requests it. When the system clock is requested by an autonomous peripheral, the system clock is woken up and distributed to all peripherals enabled in the RCC. This allows the DMA to access the enabled SRAM, and any enabled peripheral register (for instance GPIO or LPGPIO registers).
- Automatic start of the peripheral thanks to hardware synchronous or asynchronous triggers (such as I/Os edge detection and low-power timer event).
- Wake-up from Stop mode with peripheral interrupt.

The GPDMA and LPDMA are fully functional and the linked-list is updated in Stop mode, allowing the different DMA transfers to be linked without any CPU wake-up. This can be used to chain different peripherals transfers, or to write peripherals registers in order to change their configuration while remaining in Stop mode.

The DMA transfers from memory to memory can be started by hardware synchronous or asynchronous triggers, and the DMA transfers between peripherals and memories can also be gated by those triggers.

Here below some use-cases that can be done while remaining in Stop mode:

- A/D or D/A conversion triggered by a low-power timer (or any other trigger)
  - wake-up from Stop mode on analog watchdog if the A/D conversion result is out of programmed thresholds
  - wake-up from Stop mode on DMA buffer event
- Audio digital filter data transfer into SRAM
  - wake-up from Stop on sound-activity detection
- I^2C target reception or transmission, SPI reception, UART/LPUART reception
  - wake-up at the end of peripheral transfer or on DMA buffer event
- I^2C controller transfer, SPI transmission, UART/LPUART transmission, triggered by a low-power timer (or any other trigger):
  - example: sensor periodic read
  - wake-up at the end of peripheral transfer or on DMA buffer event
- Bridges between peripherals
  - example: ADC converted data transferred by communication peripherals
- Data transfer from/to GPIO/LPGPIO to/from SRAM for:
  - controlling external components
  - implementing data transmission and reception protocols

GPIOs	O	O	O	O	O	O	- (19)	24 pins	- (19)	24 pins	- (20)	24 pins	-

1. Y = yes (enabled). O = optional (disabled by default, can be enabled by software). - = not available. Gray cells highlight the wake-up capability in each mode.
2. The flash memory can be configured in power-down mode. By default, it is not in power-down mode.
3. The SRAMs can be powered on or off independently.
4. The SRAM clock can be gated on or off independently.
5. ECC error interrupt or NMI wake-up from Stop mode.
6. 8-Kbyte, 56-Kbyte or full SRAM2 content can be preserved.
7. Sub-blocks or full SRAM1, SRAM3, SRAM5, and SRAM6, full SRAM2 and SRAM4 can be powered-off to save power consumption. SRAM1, SRAM2, SRAM3, SRAM4, SRAM5, and SRAM6 can be accessed by GPDMA1 in Stop 0 and Stop 1 modes. SRAM4 can be accessed by LPDMA1 in Stop 0, Stop 1 and Stop 2 modes.
8. GPDMA transfers are functional and autonomous in Stop mode, and generates a wake-up interrupt on transfer events.

Downloaded from Arrow.com.

9. LPDMA transfers are functional and autonomous in Stop mode, and generates a wake-up interrupt on transfer events.
10. Some peripherals with autonomous mode and wake-up from Stop capability can request HSI16, MSIS or MSIK to be enabled. In this case, the oscillator is woken up by the peripheral, and is automatically put off when no peripheral needs it.
11. OTG_HS is functional in voltage scaling range 1 and 2.
12. OTG_HS cannot wake up from Stop mode 1.
13. USART and LPUART reception and transmission are functional and autonomous in Stop mode in asynchronous and in SPI master modes, and generate a wake-up interrupt on transfer events.
14. I2C reception and transmission are functional and autonomous in Stop mode, and generate a wake-up interrupt on transfer events.
15. SPI reception and transmission are functional and autonomous in Stop mode, and generate a wake-up interrupt on transfer events.
16. A/D conversion is functional and autonomous in Stop mode, and generates a wake-up interrupt on conversion events.
17. LPTIM is functional and autonomous in Stop mode, and generates a wake-up interrupt on events.
18. MDF and ADF are functional and autonomous in Stop mode, and generate a wake-up interrupt on events.
19. I/Os can be configured with internal pull-up, pull-down or floating in Stop 3 and Standby modes.
20. I/Os can be configured with internal pull-up, pull-down or floating in Shutdown mode but the configuration is lost when exiting the Shutdown mode.

3.9.4 Reset mode

In order to improve the consumption under reset, the I/O state under and after reset is “analog state” (the I/O Schmitt trigger is disabled). In addition, the internal reset pull-up is deactivated when the reset source is internal.

3.9.5 V_{BAT} operation

The VBAT pin allows the device V_{BAT} domain to be powered from an external battery or an external super-capacitor.

The VBAT pin supplies the RTC with LSE, anti-tamper detection (TAMP), backup registers and 2-Kbyte backup SRAM. Eight anti-tamper detection pins are available in V_{BAT} mode.

The V_{BAT} operation is automatically activated when V_{DD} is not present. An internal V_{BAT} battery charging circuit is embedded and can be activated when V_{DD} is present.

Note: When the microcontroller is supplied from V_{BAT}, neither external interrupts nor RTC/TAMP alarm/events exit the microcontroller from the V_{BAT} operation.

3.9.6 PWR TrustZone security

When the TrustZone security is activated by the TZEN option bit, the PWR is switched in TrustZone security mode.

The PWR TrustZone security secures the following configuration:

- low-power mode
- WKUP (wake-up) pins
- voltage detection and monitoring
- V_{BAT} mode

Some of the PWR configuration bits security is defined by the security of other peripherals:

- The VOS (voltage scaling) configuration is secure when the system clock selection is secure in RCC.

Downloaded from Arrow.com.

- The I/O pull-up/pull-down in Standby mode configuration is secure when the corresponding GPIO is secure.

3.10 Peripheral interconnect matrix

Several peripherals have direct connections between them, that allow autonomous communication between them and support the saving of CPU resources (thus power supply consumption). In addition, these hardware connections allow fast and predictable latency.

Depending on the peripherals, these interconnections can operate in Run, Sleep, Stop 0, Stop 1, and Stop 2 modes.

3.11 Reset and clock controller (RCC)

The RCC (reset and clock control) manages the different reset types, and generates all clocks for the bus and peripherals.

The RCC distributes the clocks coming from the different oscillators to the core and to the peripherals. It also manages the clock gating for low-power modes and ensures the clock robustness. It features:

- Clock prescaler: in order to get the best trade-off between speed and current consumption, the clock frequency to the CPU and peripherals can be adjusted by a programmable prescaler.
- Clock security system: clock sources can be changed safely on-the-fly in Run mode through a configuration register.
- Clock management: in order to reduce the power consumption, the clock controller can stop the clock to the core, individual peripherals or memory.
- System clock source: four different clock sources can be used to drive the master clock SYSCLK:
  - HSE (4 to 50 MHz high-speed external crystal or ceramic resonator) that can supply a PLL. The HSE can also be configured in bypass mode for an external clock.
  - HSI16 (16 MHz high-speed internal RC oscillator) trimmable by software, that can supply a PLL.
  - MSI (multispeed internal RC oscillator) trimmable by software, that can generate 16 frequencies from 100 kHz to 48 MHz. When a 32.768 kHz clock source is available in the system (LSE), the MSI frequency can be automatically trimmed by hardware to reach better than ±0.25% accuracy. In this mode the MSI can feed the USB device, saving the need of an external high-speed crystal (HSE). The MSI can supply a PLL.
  - System PLL that can be fed by HSE, HSI16 or MSI, with a maximum frequency at 160 MHz.
- HSI48 (RC48 with clock recovery system) internal 48 MHz clock source that can be used to drive the USB, the SDMMC or the RNG peripherals. This clock can be output on the MCO.
- UCPD kernel clock, derived from HSI16 clock. The HSI16 RC oscillator must be enabled prior to the UCPD kernel clock use.
- Auxiliary clock source: two ultra-low-power clock sources that can be used to drive the real-time clock:

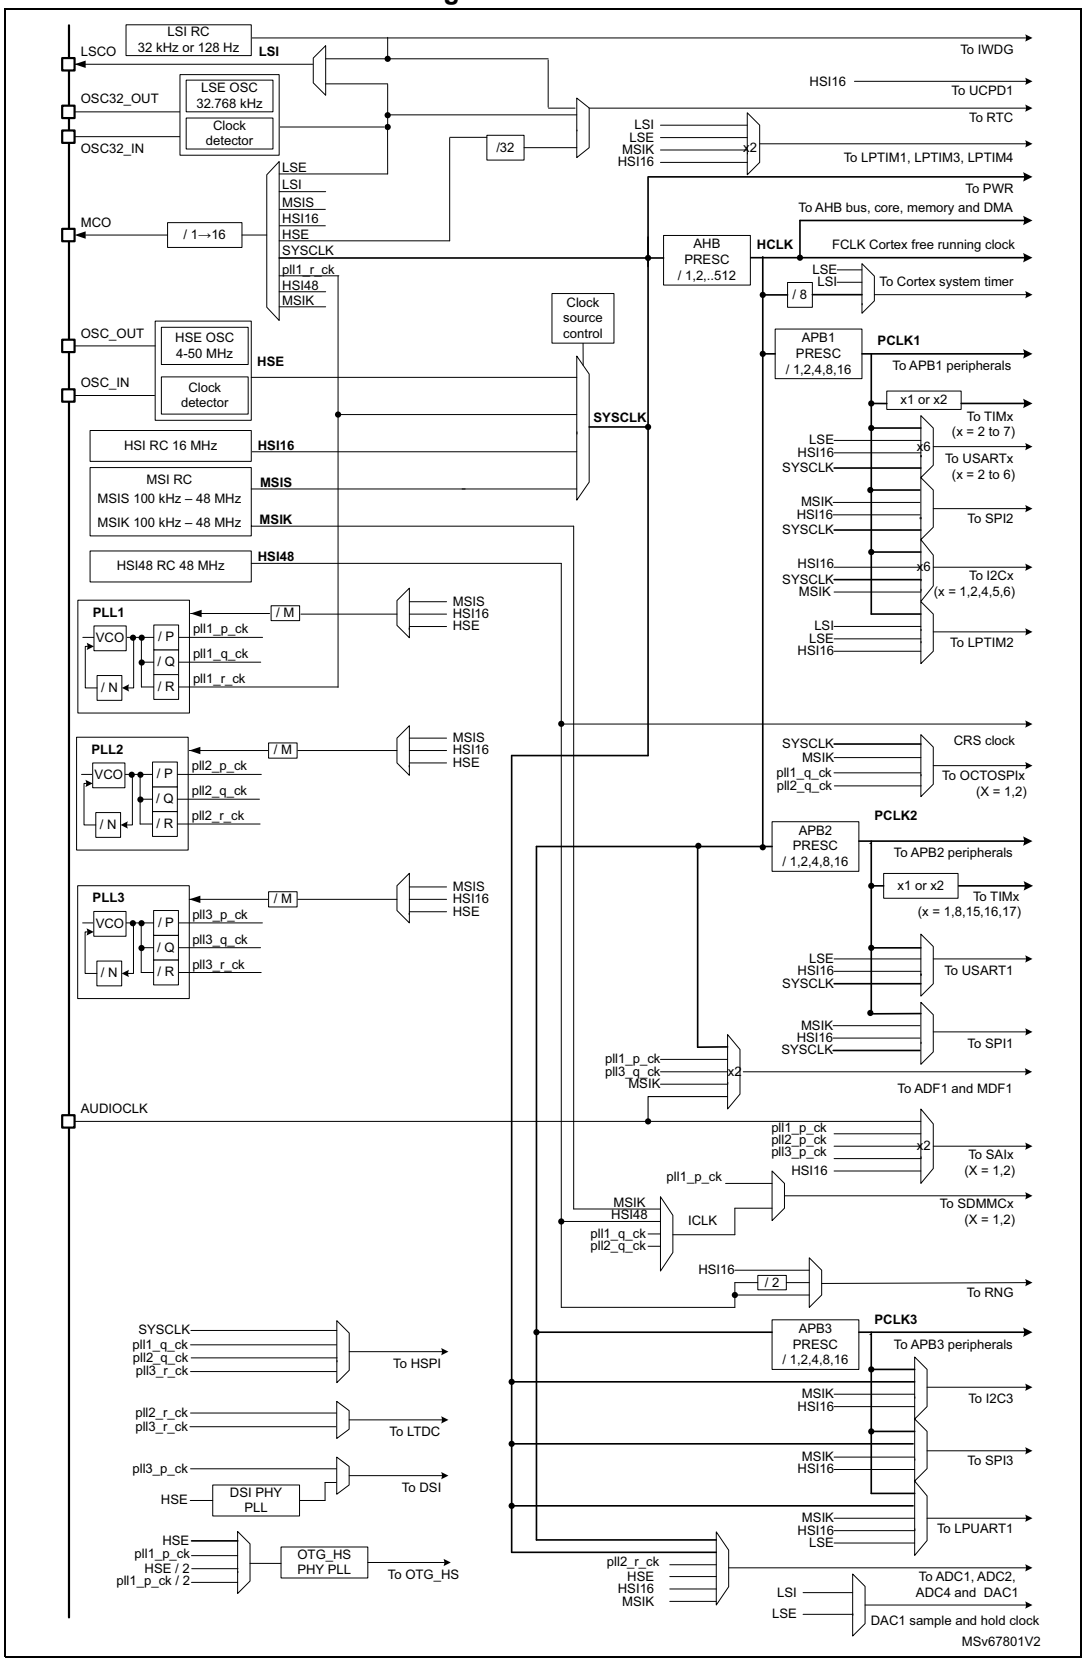
Downloaded from Arrow.com.

  - LSE (32.768 kHz low-speed external crystal), supporting three drive capability modes. The LSE can also be configured in bypass mode for an external clock.
  - LSI (32 kHz low-speed internal RC), also used to drive the independent watchdog. The LSI clock accuracy is ±5% accuracy. The LSI clock can be divided by 128 to output a 250 Hz as source clock.
- Peripheral clock sources: several peripherals have their own independent clock whatever the system clock. Three PLLs, each having three independent outputs allowing the highest flexibility, can generate independent clocks for the ADC, USB, SDMMC, RNG, MDF, ADF, OCTOSPIs, HSPI, LTDC, DSI and SAIs.
- Startup clock: after reset, the microcontroller restarts by default with MSI. The prescaler ratio and clock source can be changed by the application program as soon as the code execution starts.
- CSS (clock security system): this feature can be enabled by software. If a HSE clock failure occurs, the master clock automatically switches to HSI16 and a software interrupt is generated if enabled. LSE failure can also be detected and generates an interrupt.
- Clock-out capability:
  - MCO (microcontroller clock output): it outputs one of the internal clocks for external use by the application.
  - LSCO (low-speed clock output): it outputs LSI or LSE in all low-power modes (except V_{BAT} mode).

Several prescalers allow AHB and APB frequencies configuration. The maximum frequency of the AHB and the APB clock domains is 160 MHz.

Downloaded from Arrow.com.

Figure 4. Clock tree



Downloaded from Arrow.com.

3.11.1 RCC TrustZone security

When the TrustZone security is activated by the TZEN option bit, the RCC is switched in TrustZone security mode.

The RCC TrustZone security secures some RCC system configuration and peripheral configuration clock from being read or modified by nonsecure accesses: when a peripheral is secure, the related peripheral clock, reset, clock source selection and clock enable during low-power modes control bits are secure.

A peripheral is in secure state:

- when its corresponding SEC security bit is set in the TZSC (TrustZone security controller), for securable peripherals.
- when a security feature of this peripheral is enabled through its dedicated bits, for TrustZone-aware peripherals.

3.12 Clock recovery system (CRS)

The devices embed a special block that allows automatic trimming of the internal 48 MHz oscillator to guarantee its optimal accuracy over the whole device operational range. This automatic trimming is based on the external synchronization signal, that is either derived from LSE oscillator, from an external signal on CRS_SYNC pin or generated by user software. For faster lock-in during startup, automatic trimming and manual trimming action can be combined.

3.13 General-purpose inputs/outputs (GPIOs)

Each of the GPIO pins can be configured by software as output (push-pull or open-drain), as input (with or without pull-up or pull-down) or as peripheral alternate function. Most of the GPIO pins are shared with digital or analog alternate functions.

After reset, all GPIOs are in analog mode to reduce power consumption.

The I/Os alternate function configuration can be locked if needed following a specific sequence in order to avoid spurious writing to the I/Os registers.

3.13.1 GPIOs TrustZone security

Each I/O pin of GPIO port can be individually configured as secure. When the selected I/O pin is configured as secure, its corresponding configuration bits for alternate function, mode selection, I/O data are secure against a nonsecure access. The associated registers bit access is restricted to a secure software only. After reset, all GPIO ports are secure.

3.14 Low-power general-purpose inputs/outputs (LPGPIO)

The LPGPIO allows dynamic I/O control in Stop 2 mode thanks to LPDMA1. Up to 16 I/Os can be configured and controlled as input or output (open-drain or push-pull depending on GPIO configuration).

Downloaded from Arrow.com.

LPGPIO TrustZone security

Each I/O pin registers bit of the LPGPIO is configured as secure if the corresponding I/O is configured as secure in the GPIO.

3.15 Multi-AHB bus matrix

A 32-bit multi-AHB bus matrix interconnects all the master (CPU, DMA2D, GFXMMU, GPDMA1, GPU2D, LTDC, OTG_HS, SDMMC1, SDMMC2) and the slave (flash memory, FMC, HSPI, OCTOSPIs, SRAMs, AHB and APB) peripherals. It also ensures a seamless and efficient operation even when several high-speed peripherals work simultaneously.

Another multi-AHB bus matrix interconnects two masters (previous AHB bus matrix slave port and LPDMA1) and all slaves that are functional in Stop 2 modes (SRAM4 and AHB/APB peripherals functional in Stop 2 mode).

3.16 System configuration controller (SYSCFG)

The STM32U5Fxxx devices feature a set of configuration registers. The main purposes of the system configuration controller are the following:

- Managing robustness feature
- Configuring FPU interrupts
- Enabling/disabling the FMP high-drive mode of some I/Os and voltage booster for I/Os analog switches
- Managing the I/O compensation cell
- Configuring register security access
- Configuring the USB HS PHY
- Adjust the HSPI supply capacitance

3.17 General purpose direct memory access controller (GPDMA)

The general purpose direct memory access (GPDMA) controller is a bus master and system peripheral.

The GPDMA is used to perform programmable data transfers between memory-mapped peripherals and/or memories via linked-lists, upon the control of an off-loaded CPU.

The GPDMA main features are:

- Dual bidirectional AHB master
- Memory-mapped data transfers from a source to a destination:
  - Peripheral-to-memory
  - Memory-to-peripheral
  - Memory-to-memory
  - Peripheral-to-peripheral
- Autonomous data transfers during Sleep and Stop modes

Downloaded from Arrow.com.

- Transfers arbitration based on a four-grade programmed priority at a channel level:
  - One high-priority traffic class, for time-sensitive channels (queue 3)
  - Three low-priority traffic classes, with a weighted round-robin allocation for non time-sensitive channels (queues 0, 1, 2)
- Per channel event generation, on any of the following events: transfer complete or half transfer complete or data transfer error or user setting error, and/or update linked-list item error or completed suspension
- Per channel interrupt generation, with separately programmed interrupt enable per event
- 16 concurrent DMA channels:
  - Per channel FIFO for queuing source and destination transfers
  - Intra-channel DMA transfers chaining via programmable linked-list into memory, supporting two execution modes: run-to-completion and link step mode
  - Intra-channel and inter-channel DMA transfers chaining via programmable DMA input triggers connection to DMA task completion events
- Per linked-list item within a channel:
  - Separately programmed source and destination transfers
  - Programmable data handling between source and destination: byte-based reordering, packing or unpacking, padding or truncation, sign extension and left/right realignment
  - Programmable number of data bytes to be transferred from the source, defining the block level
  - 12 channels with linear source and destination addressing: either fixed or contiguously incremented addressing, programmed at a block level, between successive single transfers
  - Four channels with 2D source and destination addressing: programmable signed address offsets between successive burst transfers (non-contiguous addressing within a block, combined with programmable signed address offsets between successive blocks, at a second 2D/repeated block level)
  - Support for scatter-gather (multi-buffer transfers), data interleaving and deinterleaving via 2D addressing
  - Programmable DMA request and trigger selection
  - Programmable DMA half-transfer and transfer complete events generation
  - Pointer to the next linked-list item and its data structure in memory, with automatic update of the DMA linked-list control registers
- Debug:
  - Channel suspend and resume support
  - Channel status reporting including FIFO level and event flags
- TrustZone support:
  - Support for secure and nonsecure DMA transfers, independently at a first channel level, and independently at a source/destination and link sub-levels
  - Secure and nonsecure interrupts reporting, resulting from any of the respectively secure and nonsecure channels
  - TrustZone-aware AHB slave port, protecting any DMA secure resource (register, register field) from a nonsecure access

Downloaded from Arrow.com.

- Privileged/unprivileged support:
  - Support for privileged and unprivileged DMA transfers, independently at channel level
  - Privileged-aware AHB slave port.

Table 11. GPDMA1 channels implementation and usage

Channel x	Hardware parameters		Features
	dma_fifo_size[x]	dma_addressing[x]	
x = 0 to 11	2	0	Channel x (x = 0 to 11) is implemented with: – a FIFO of 8 bytes, 2 words – fixed/contiguously incremented addressing These channels may be also used for GPDMA transfers, between an APB or AHB peripheral and SRAM.
x = 12 to 15	4	1	Channel x (x = 12 to 15) is implemented with: – a FIFO of 32 bytes, 8 words – 2D addressing These channels may be also used for GPDMA transfers, between a demanding AHB peripheral and SRAM, or for transfers from/to external memories.

Table 12. GPDMA1 autonomous mode and wake-up in low-power modes

Feature	Low-power modes
Autonomous mode and wake-up	GPDMA1 in Sleep, Stop 0, and Stop 1 modes

3.18 Low-power direct memory access controller (LPDMA)

The LPDMA controller is a bus master and system peripheral. The LPDMA is used to perform programmable data transfers between memory-mapped peripherals and/or memories via linked-lists, upon the control of an off-loaded CPU.

The LPDMA main features are:

- Single bidirectional AHB master
- Memory-mapped data transfers from a source to a destination:
  - Peripheral-to-memory
  - Memory-to-peripheral
  - Memory-to-memory
  - Peripheral-to-peripheral
- Autonomous data transfers during Sleep and Stop modes
- Transfers arbitration based on a 4-grade programmed priority at channel level:
  - One high-priority traffic class, for time-sensitive channels (queue 3)
  - Three low-priority traffic classes, with a weighted round-robin allocation for non time-sensitive channels (queues 0, 1, 2)

Downloaded from Arrow.com.

- Per channel event generation, on any of the following events: transfer complete, or half-transfer complete, or data transfer error, or user setting error, and/or update linked-list item error, or completed suspension
- Per channel interrupt generation, with separately programmed interrupt enable per event
- Four concurrent DMA channels:
  - Intra-channel DMA transfers chaining via programmable linked-list into memory, supporting two execution modes: run-to-completion and link step mode
  - Intra-channel and inter-channel DMA transfers chaining via programmable DMA input triggers connection to DMA task completion events
- Per linked-list item within a channel:
  - Separately programmed source and destination transfers
  - Programmable data handling between source and destination: byte-based padding or truncation, sign extension and left/right realignment
  - Programmable number of data bytes to be transferred from the source, defining the block level
  - Linear source and destination addressing: either fixed or contiguously incremented addressing, programmed at a block level, between successive single transfers
  - Programmable DMA request and trigger selection
  - Programmable DMA half-transfer and transfer complete events generation
  - Pointer to the next linked-list item and its data structure in memory, with automatic update of the DMA linked-list control registers
- Debug:
  - Channel suspend and resume support
  - Channel status reporting and event flags
- TrustZone support
  - Support for secure and nonsecure DMA transfers, independently at a first channel level, and independently at a source/destination and link sub-levels
  - Secure and nonsecure interrupts reporting, resulting from any of the respectively secure and nonsecure channels
  - TrustZone-aware AHB slave port, protecting any DMA secure resource (register, register field) from a nonsecure access
- Privileged/unprivileged support:
  - Support for privileged and unprivileged DMA transfers, independently at channel level
  - Privileged-aware AHB slave port.

Table 13.LPDMA1 channels implementation and usage

Channel x	Hardware parameters		Features
	dma_fifo_ size[x]	dma_ addressing[x]	
x = 0 to 3	0	0	Channel x (x = 0 to 3) is implemented with: – no FIFO. Only a single source transfer cell is internally registered. – fixed/contiguously incremented addressing

Downloaded from Arrow.com.

Table 14. LPDMA1 autonomous mode and wake-up in low-power modes

Feature	Low-power modes
Autonomous mode and wake-up	LPDMA1 in Sleep, Stop 0, Stop 1, and Stop 2 modes

3.19 Neo-Chrom graphic processor (GPU2D)

The GPU2D is a dedicated graphics processing unit accelerating numerous 2.5D graphics applications such as graphical user interface (GUI), menu display or animations. It works together with an optimized software stack designed for state of the art graphic rendering.

The GPU2D main features are:

- Multi-threaded fragment (pixel) processing core with a VLIW (very-long instruction word) instruction set
- Fixed point functional units
- Command list based DMAs to minimize CPU overhead
- Two 32-bit AHB master interfaces for texture, command list and framebuffer access
- 32-bit AHB slave interface for register bank access
- Up to 4 general-purpose flags for system-level synchronization
- Texture decompression unit with TSC™4 and TSC™6/TSC™6a support

The GPU2D also features:

- 2D drawing
  - Pixel/line drawing
  - Filled rectangles
  - Triangles, quadrilateral drawing
  - Anti-aliasing 8xMSAA (multi-sample anti-aliasing)
- Vector graphic acceleration
  - Path drawing (lines, polygons, rectangles, arcs, ellipses, circles)
  - Bezier curves (cubic and quadratic)
  - Path transformation (3x3 matrix)
  - Path stroking
  - Filling (event-odd and non-zero with 8x MSAA anti-aliasing)
  - Gradient generation (linear, radial, conic)
- Image transformations
  - 3D perspective correct projections
  - Texture mapping with bilinear filtering or point sampling
- Blit support
  - Rotation, mirroring, stretching (independently on x and y axis)
  - Source and/or destination color keying
  - Pixel format conversions
- Text rendering support
  - A1, A2, A4 and A8 bitmap anti-aliased

Downloaded from Arrow.com.

  - Subsampled anti-aliased
- Color formats
  - RGB, grayscale
  - 32, 24, 16 and 8 bits with/without alpha
- Full alpha blending with hardware blender
  - Programmable blending modes
  - Source/destination color keying

3.20 Chrom-ART Accelerator controller (DMA2D)

The Chrom-Art Accelerator (DMA2D) is a specialized DMA dedicated to image manipulation. It can perform the following operations:

- Filling a part or the whole of a destination image with a specific color
- Copying a part or the whole of a source image into a part or the whole of a destination image
- Copying a part or the whole of a source image into a part or the whole of a destination image with a pixel format conversion
- Blending a part and/or two complete source images with different pixel format and copy the result into a part or the whole of a destination image with a different color format

All the classical color coding schemes are supported from 4-bit up to 32-bit per pixel with indexed or direct color mode, including block based YCbCr to handle JPEG decoder output. The DMA2D has its own dedicated memories for CLUTs (color look-up tables).

The main DMA2D features are:

- Single AHB master bus architecture
- AHB slave programming interface supporting 8-, 16-, 32-bit accesses (except for CLUT accesses which are 32-bit)
- User-programmable working area size
- User-programmable offset for sources and destination areas expressed in pixels or bytes
- User-programmable sources and destination addresses on the whole memory space
- Up to two sources with blending operation
- Alpha value that can be modified (source value, fixed value, or modulated value)
- User programmable source and destination color format
- Up to 12 color formats supported from 4-bit up to 32-bit per pixel with indirect or direct color coding
- Block based (8x8) YCbCr support with 4:4:4, 4:2:2 and 4:2:0 chroma sub-sampling factors
- 2 internal memories for CLUT storage in indirect color mode
- Automatic CLUT loading or CLUT programming via the CPU
- User programmable CLUT size
- Internal timer to control AXI bandwidth
- 6 operating modes: register-to-memory, memory-to-memory, memory-to-memory with pixel format conversion, memory-to-memory with pixel format conversion and blending, memory-to memory with pixel format conversion, blending and fixed color foreground,

Downloaded from Arrow.com.

and memory-to memory with pixel format conversion, blending and fixed color background.

- Area filling with a fixed color
- Copy from an area to another
- Copy with pixel format conversion between source and destination images
- Copy from two sources with independent color format and blending
- Output buffer byte swapping to support refresh of displays through parallel interface
- Abort and suspend of DMA2D operations
- Watermark interrupt on a user programmable destination line
- Interrupt generation on bus error or access conflict
- Interrupt generation on process completion

3.21 Chrom-GRC (GFXMMU)

The GFXMMU is a graphical oriented memory management unit aimed to:

- Optimize memory usage according to the display shape
- Cache linear accesses to the frame buffer
- Prefetch data

The GFXMMU main features are:

- Fully programmable display shape to physically store only the visible pixel
- Up to 4 virtual buffers
- Each virtual buffer have 3072 or 4096 bytes per line and 1024 lines
- Each virtual buffer can be physically mapped to any system memory
- Optional cache for linear accesses
- Cache can be locked to a virtual buffer
- Cache prefetch mechanism for linear accesses anticipation
- Interrupt in case of buffer overflow (1 per buffer)
- Interrupt in case of memory transfer error

3.22 JPEG codec (JPEG)

The hardware 8-bit JPEG codec encodes uncompressed image data stream or decodes JPEG-compressed image data stream. It also fully manages JPEG headers.

The JPEG main features are:

- High-speed fully-synchronous operation
- Configurable as encoder or decoder
- Single-clock-per-pixel encode/decode
- RGB, YCbCr, YCMK and BW (grayscale) image color space support
- 8-bit depth per image component at encode/decode
- JPEG header generator/parser with enable/disable
- Four programmable quantization tables
- Single-clock Huffman coding and decoding

Downloaded from Arrow.com.

- Fully-programmable Huffman tables (two AC and two DC)
- Fully-programmable minimum coded unit (MCU)
- Concurrent input and output data stream interfaces

3.23 Graphic timer (GFXTIM)

The graphic timer (GFXTIM) is a graphic oriented timer allowing smart management of graphical events for frame or line counting.

The GFXTIM main features are:

- Integrated frame and line clock generation
- One absolute frame counter with one compare channel
- Two auto-reload relative frame counters
- One line timer with two compare channels
- External tearing-effect line management and synchronization
- Four programmable event generators with external trigger generation
- One watchdog counter

3.24 Interrupts and events

3.24.1 Nested vectored interrupt controller (NVIC)

The devices embed a NVIC that is able to manage 16 priority levels and to handle up to 138 maskable interrupt channels plus the 16 interrupt lines of the Cortex-M33.

The NVIC benefits are the following:

- closely coupled NVIC giving low-latency interrupt processing
- interrupt entry vector table address passed directly to the core
- early processing of interrupts
- processing of late arriving higher priority interrupts
- support for tail chaining
- processor state automatically saved
- interrupt entry restored on interrupt exit with no instruction overhead
- TrustZone support: NVIC registers banked across secure and nonsecure states

The NVIC hardware block provides flexible interrupt management features with minimal interrupt latency.

3.24.2 Extended interrupt/event controller (EXTI)

The EXTI manages the individual CPU and system wake-up through configurable event inputs. It provides wake-up requests to the power control, and generates an interrupt request to the CPU NVIC and events to the CPU event input. For the CPU an additional event generation block (EVG) is needed to generate the CPU event signal.

The EXTI wake-up requests allow the system to be woken up from Stop modes.

The interrupt request and event request generation can also be used in Run modes. The EXTI also includes the EXTI multiplexer I/O port selection.

Downloaded from Arrow.com.

The EXTI main features are the following:

- All event inputs allowed to wake up the system
- Configurable events (signals from I/Os or peripherals able to generate a pulse)
  - Selectable active trigger edge
  - Interrupt pending status register bit independent for the rising and falling edge
  - Individual interrupt and event generation mask, used for conditioning the CPU wake-up, interrupt and event generation
  - Software trigger possibility
- TrustZone secure events
  - The access to control and configuration bits of secure input events can be made secure
- EXTI I/O port selection

3.25 Cyclic redundancy check calculation unit (CRC)

The CRC is used to get a CRC code using a configurable generator with polynomial value and size.

Among other applications, the CRC-based techniques are used to verify data transmission or storage integrity. In the scope of the EN/IEC 60335-1 standard, they offer a mean to verify the flash memory integrity.

The CRC calculation unit helps to compute a signature of the software during runtime, that can be ulteriorly compared with a reference signature generated at link-time and that can be stored at a given memory location.

3.26 CORDIC co-processor (CORDIC)

The CORDIC co-processor provides hardware acceleration of certain mathematical functions, notably trigonometric, commonly used in motor control, metering, signal processing and many other applications. It speeds up the calculation of these functions compared to a software implementation, allowing a lower operating frequency, or freeing up processor cycles in order to perform other tasks.

The CORDIC main features are:

- 24-bit CORDIC rotation engine
- Circular and hyperbolic modes
- Rotation and vectoring modes
- Functions: sine, cosine, sinh, cosh, atan, atan2, atanh, modulus, square root, natural logarithm
- Programmable precision
- Low-latency AHB slave interface
- Results can be read as soon as ready without polling or interrupt
- DMA read and write channels
- Multiple register read/write by DMA

Downloaded from Arrow.com.

3.27 Filter math accelerator (FMAC)

The FMAC performs arithmetic operations on vectors. It comprises a MAC (multiplier/accumulator) unit, together with address generation logic that allows it to index vector elements held in local memory.

The unit includes support for circular buffers on input and output, that allows digital filters to be implemented. Both finite and infinite impulse response filters can be done.

The unit allows frequent or lengthy filtering operations to be offloaded from the CPU, freeing up the processor for other tasks. In many cases it can accelerate such calculations compared to a software implementation, resulting in a speed-up of time critical tasks.

The FMAC main features are:

- 16 x 16-bit multiplier
- 24 + 2-bit accumulator with addition and subtraction
- 16-bit input and output data
- 256 x 16-bit local memory
- Up to three areas can be defined in memory for data buffers (two input, one output), defined by programmable base address pointers and associated size registers
- Input and output buffers can be circular
- Filter functions: FIR, IIR (direct form 1)
- Vector functions: dot product, convolution, correlation
- AHB slave interface
- DMA read and write data channels

3.28 Flexible static memory controller (FSMC)

The FSMC includes two memory controllers:

- NOR/PSRAM memory controller
- NAND/memory controller

The FSMC is also named flexible memory controller (FMC).

The main features of the FSMC are the following:

- Interface with static-memory mapped devices including:
  - Static random access memory (SRAM)
  - NOR flash memory/OneNAND flash memory
  - PSRAM (four memory banks)
  - NAND flash memory with ECC hardware to check up to 8 Kbytes of data
  - Ferroelectric RAM (FRAM)
- 8-, 16- bit data bus width
- Independent chip select control for each memory bank
- Independent configuration for each memory bank
- Write FIFO

Downloaded from Arrow.com.

3.28.1 LCD parallel interface

The FSMC can be configured to interface seamlessly with most graphic LCD controllers. It supports the Intel® 8080 and Motorola® 6800 modes, and is flexible enough to adapt to specific LCD interfaces.

This LCD parallel interface capability makes it easy to build cost effective graphic applications using LCD modules with embedded controllers or high-performance solutions using external controllers with dedicated acceleration.

3.28.2 FSMC TrustZone security

When the TrustZone security is enabled, the whole FSMC banks are secure after reset. Nonsecure area can be configured using the TZSC MPCWMx controller:

- FSMC NOR/PSRAM bank:
  - Up to two nonsecure area can be configured thought the TZSC MPCWM2 controller with a 64-Kbyte granularity
- FSMC NAND bank:
  - Can be either configured as fully secure or fully nonsecure using the TZSC MPCWM3 controller

The FSMC registers can be configured as secure through the TZSC controller.

3.29 Octo-SPI interface (OCTOSPI)

The OCTOSPI supports most external serial memories such as serial PSRAMs, serial NAND and serial NOR flash memories, HyperRAMs™ and HyperFlash™ memories, with the following functional modes:

- indirect mode: all the operations are performed using the OCTOSPI registers.
- automatic status-polling mode: the external memory status register is periodically read and an interrupt can be generated in case of flag setting.
- memory-mapped mode: the external memory is memory mapped and is seen by the system as if it were an internal memory supporting read and write operation.

The OCTOSPI supports the following protocols with associated frame formats:

- the standard frame format with the command, address, alternate byte, dummy cycles and data phase
- the HyperBus™ frame format

The OCTOSPI offers the following features:

- Three functional modes: indirect, automatic status-polling, and memory-mapped
- Read and write support in memory-mapped mode
- Supports for single, dual, quad and octal communication
- Dual-quad mode, where eight bits can be sent/received simultaneously by accessing two quad memories in parallel.
- SDR (single-data rate) and DTR (double-transfer rate) support
- Data strobe support
- Fully programmable opcode
- Fully programmable frame format

Downloaded from Arrow.com.

- HyperBus support
- Integrated FIFO for reception and transmission
- 8-, 16-, and 32-bit data accesses allowed
- DMA channel for indirect mode operations
- Interrupt generation on FIFO threshold, timeout, operation complete, and access error

3.29.1 OCTOSPI TrustZone security

When the TrustZone security is enabled, the whole OCTOSPI bank is secure after reset.

Up to two nonsecure area can be configured thought the TZSC MPCWM1 and MPCWM5 controllers with a granularity of 64 Kbytes.

The OCTOSPI registers can be configured as secure through the TZSC controller.

3.30 OCTOSPI I/O manager (OCTOSPIM)

The OCTOSPI I/O manager is a low-level interface enabling:

- efficient OCTOSPI pin assignment with a full I/O matrix (before alternate function map)
- multiplex of Single-, Dual-, Quad-, Octal-SPI interfaces over the same bus and hence support memories embedded in a multichip package

The OCTOSPIM main features are:

- Supports up to two Single-, Dual-, Quad-, Octal-SPI interfaces
- Supports up to two ports for pin assignment
- Fully programmable I/O matrix for pin assignment by function (data/control/clock)

3.31 Delay block (DLYB)

The delay block (DLYB) is used to generate an output clock that is dephased from the input clock. The phase of the output clock must be programmed by the user application. The output clock is then used to clock the data received by another peripheral such as a SDMMC or Octo-SPI interface. The delay is voltage and temperature dependent, that may require the application to re-configure and recenter the output clock phase with the received data.

The delay block main features are:

- Input clock frequency ranging from 25 to 160 MHz
- Up to 12 oversampling phases

3.32 Hexadeca-SPI interface (HSPI)

The HSPI supports most external serial memories such as serial PSRAMs, serial NAND and serial NOR flash memories, HyperRAMs and HyperFlash memories, with the following functional modes:

- indirect mode: all the operations are performed using the HSPI registers.
- automatic status polling mode: the external memory status register is periodically read and an interrupt can be generated in case of flag setting.

Downloaded from Arrow.com.

- memory-mapped mode: the external memory is memory mapped and is seen by the system as if it were an internal memory supporting read and write operation.

The HSPI supports the following protocols with associated frame formats:

- the standard frame format with the command, address, alternate byte, dummy cycles and data phase
- the HyperBus frame format

The HSPI offers the following features:

- Three functional modes: indirect, automatic status-polling, and memory-mapped
- Read and write support in Memory-mapped mode
- Support for single, dual, quad, octal and hexadeca communication
- Dual-quad mode, where eight bits can be sent/received simultaneously by accessing two quad or two octal memories in parallel
- SDR (single-data rate) and DTR (double-transfer rate) support
- Data strobe support
- Fully programmable opcode
- Fully programmable frame format
- Support wrapped-type access to memory in read direction
- HyperBus support
- Integrated FIFO for reception and transmission
- 8-, 16-, and 32-bit data accesses allowed
- DMA channel for indirect mode operations
- Interrupt generation on FIFO threshold, timeout, operation complete, and access error
- High-speed interface up to 160 MHz

3.32.1 HSPI TrustZone security

When the TrustZone security is enabled, the whole HSPI bank is secure after reset.

Up to two nonsecure areas can be configured thought the TZSC MPCWM6 controller with a granularity of 64 Kbytes.

The HSPI registers can be configured as secure through the TZSC controller.

3.33 Analog-to-digital converters (ADC1, ADC2, and ADC4)

The devices embed three successive approximation analog-to-digital converters.

Table 15. ADC features

ADC modes/features(1)	ADC1	ADC2	ADC4
Resolution	14 bits		12 bits
Maximum sampling speed for maximum resolution	2.5 Msps		
Hardware offset calibration	X		
Hardware linearity calibration	X		-
Single-ended inputs	X		

Downloaded from Arrow.com.

Table 15. ADC features (continued)

ADC modes/features[1]	ADC1	ADC2	ADC4
Differential inputs	X		-
Injected channel conversion	X		-
Oversampling	up to x1024		up to x256
Data register	32 bits		16 bits
DMA support	X		
Parallel data output to MDF	X		-
Dual mode	X		-
Autonomous mode	-		X
Offset compensation	X		-
Gain compensation	X		-
Number of analog watchdogs	3		
Wake-up from Stop mode	-		X[2]

1. X = supported.
2. Wake-up supported from Stop 0, Stop 1 and Stop 2 modes.

3.33.1 Analog-to-digital converters (ADC1/2)

The ADC1/2 are 14-bit ADC successive approximation analog-to-digital converters.

Each ADC has up to 20 multiplexed channels. A/D conversion of the various channels can be performed in Single, Continuous, Scan or Discontinuous mode. The result of the ADC is stored in a left-aligned or right-aligned 32-bit data register.

The ADC1/2 are mapped on the AHB bus to allow fast data handling. The analog watchdog features allow the application to detect if the input voltage goes outside the user-defined high or low thresholds.

A built-in hardware over sampler allows analog performances to be improved while off-loading the related computational burden from the CPU.

An efficient low-power mode is implemented to allow very low consumption at low frequency.
The ADC1/2 main features are:

- High-performance features
  - Dual mode operation
  - 14-, 12-, 10- or 8-bit configurable resolution
  - A/D conversion time independent from the AHB bus clock frequency
  - Faster conversion time by lowering resolution
  - Management of single-ended or differential inputs (programmable per channels)
  - Fast data handling thanks to the AHB slave bus interface
  - Self-calibration (both offset and linearity)
  - Channel-wise programmable sampling time
  - Flexible sampling time control

Downloaded from Arrow.com.

  - Up to four injected channels (analog inputs assignment to regular or injected channels is fully configurable)
  - Fast context switching thanks to the hardware assistant that prepares the context of the injected channels
  - Data alignment with in-built data coherency
  - Data can be managed by GPDMA for regular channel conversions with FIFO
  - Data can be routed to MDF for post processing
  - Four dedicated data registers for the injected channels
- Oversampler
  - 32-bit data register
  - Oversampling ratio adjustable from 2 to 1024
  - Programmable data right and left shift
- Data preconditioning
  - Gain compensation
  - Offset compensation
- Low-power features
  - Speed adaptive low-power mode to reduce ADC consumption when operating at low frequency
  - Slow bus frequency application while keeping optimum ADC performance
  - Automatic control to avoid ADC overrun in low AHB bus clock frequency application (auto-delayed mode)
- ADC features an external analog input channel:
  - Up to 17 channels from dedicated GPIO pads
- Three additional internal dedicated channels:
  - One channel for internal reference voltage (V_{REFINT})
  - One channel for internal temperature sensor (V_{SENSE})
  - One channel for V_{BAT} monitoring channel ($V_{BAT}/4$)
- Start-of-conversion can be initiated:
  - by software for both regular and injected conversions
  - by hardware triggers with configurable polarity (internal timers events or GPIO input events) for both regular and injected conversions
- Conversion modes
  - Single mode: the ADC converts a single channel. The conversion is triggered by a special event.
  - Scan mode: the ADC scans and converts a sequence of channels.
  - Continuous mode: the ADC converts continuously selected inputs.
  - Discontinuous mode: the ADC converts a subset of the conversion sequence.
- Interrupt generation when the ADC is ready, at end of sampling, end of conversion (regular or injected), end of sequence conversion (regular or injected), analog watchdog 1, 2 or 3 or when an overrun event occurs
- Three analog watchdogs
  - Filtering to ignore out-of-range data
- ADC input range: $V_{SSA} < V_{IN} < V_{REF+}$

Downloaded from Arrow.com.

Note: The ADC1/2 analog block clock frequency must be between 5 MHz and 55 MHz.

3.33.2 Analog-to-digital converter 4 (ADC4)

The 12-bit ADC4 is a successive approximation analog-to-digital converter. It has up to 25 multiplexed channels allowing it to measure signals from 19 external and six internal sources. A/D conversion of the various channels can be performed in Single, Continuous, Scan or Discontinuous mode. The result of the ADC is stored in a left-aligned or right-aligned 16-bit data register.

The analog watchdog feature allows the application to detect if the input voltage goes outside the user-defined higher or lower thresholds.

An efficient low-power mode is implemented to allow very low consumption at low frequency. The ADC4 is autonomous in low-power modes down to Stop 2 mode.

A built-in hardware oversampler allows analog performances to be improved while off-loading the related computational burden from the CPU.

The ADC4 main features are:

- High performance
  - 12-, 10-, 8- or 6-bit configurable resolution
  - A/D conversion time: 0.4 µs for 12-bit resolution (2.5 MHz), faster conversion times obtained by lowering resolution
  - Self-calibration
  - Programmable sampling time
  - Data alignment with built-in data coherency
  - DMA support
- Low-power
  - HCLK frequency reduced for low-power operation while still keeping optimum ADC performance
  - Wait mode: ADC overrun prevented in applications with low frequency HCLK
  - Auto-off mode: ADC automatically powered off except during the active conversion phase, dramatically reducing the ADC power consumption
  - Autonomous mode: In low-power modes down to Stop 2 mode, the ADC4 is automatically switched on when a trigger occurs to start conversion, and it is automatically switched off after conversion. Data are transfered in SRAM with DMA.
  - ADC4 interrupts wake up the device from Stop 0, Stop 1 and Stop 2 modes.
- Analog input channels
  - Up to 19 external analog inputs
  - One channel for the internal temperature sensor (VSENSE)
  - One channel for the internal reference voltage (VREFINT)
  - One channel for the internal digital core voltage (VCORE)
  - One channel for monitoring the external VBAT power supply pin
  - Connection to two DAC internal channels
- Start-of-conversion can be initiated:
  - By software

Downloaded from Arrow.com.

  - By hardware triggers with configurable polarity (timer events or GPIO input events)
- Conversion modes
  - Conversion of a single channel or scan of a sequence of channels
  - Selected inputs converted once per trigger in Single mode
  - Selected inputs converted continuously in Continuous mode
  - Discontinuous mode
- Interrupt generation at the end of sampling, end of conversion, end of sequence conversion, and in case of analog watchdog or overrun events, with wake-up from Stop capability
- Analog watchdog
- Oversampler
  - 16-bit data register
  - Oversampling ratio adjustable from 2 to 256
  - Programmable data shift up to 8 bits
- ADC supply requirements: 1.62 to 3.6 V
- ADC input range: $V_{SSA} < V_{IN} < V_{REF+}$

Note: The ADC4 analog block clock frequency must be between 140 kHz and 55 MHz.

3.33.3 Temperature sensor

The temperature sensor generates a voltage V_{SENSE} that varies linearly with temperature. The temperature sensor is internally connected to ADC1, ADC2 and ADC4 input channel that is used to convert the sensor output voltage into a digital value.

The sensor provides good linearity but it must be calibrated to obtain a good accuracy of the temperature measurement. As the offset of the temperature sensor varies from chip to chip due to process variation, the uncalibrated internal temperature sensor is suitable for applications that detect temperature changes only.

To improve the accuracy of the temperature sensor measurement, each device is individually factory-calibrated by ST. The temperature sensor factory calibration data are stored by STMicroelectronics in the system memory area, accessible in read-only mode.

Table 16. Temperature sensor calibration values

Calibration value name	Description	Memory address
TS_CAL1	Temperature sensor 14-bit raw data acquired by ADC1 at 30 °C (± 5 °C), $V_{DDA} = V_{REF+}$ = 3.0 V (± 10 mV)	0x0BFA 0710 - 0x0BFA 0711
TS_CAL2	Temperature sensor 14-bit raw data acquired by ADC1 at 130 °C (± 5 °C), $V_{DDA} = V_{REF+}$ = 3.0 V (± 10 mV)	0x0BFA 0742 - 0x0BFA 0743

3.33.4 Internal voltage reference (V_{REFINT})

The VREFINT provides a stable (bandgap) voltage output for the ADC and the comparators. The VREFINT is internally connected to ADC1, ADC2 and ADC4 input channels.

Downloaded from Arrow.com.

The precise voltage of VREFINT is individually measured for each part by STMicroelectronics during production test and stored in the system memory area. It is accessible in read-only mode.

Table 17. Internal voltage reference calibration values

Calibration value name	Description	Memory address
VREFINT_CAL	14-bit raw data acquired by ADC1 at 30 °C (± 5 °C), $V_{DDA} = V_{REF+}$ = 3.0 V (± 10 mV)	0x0BFA 07A5 - 0x0BFA 07A6

3.33.5 V_{BAT} battery voltage monitoring

This embedded hardware enables the application to measure the V_{BAT} battery voltage using ADC1, ADC2 or ADC4 input channel. As the V_{BAT} voltage may be higher than the V_{DDA}, and thus outside the ADC input range, the VBAT pin is internally connected to a bridge divider by four. As a consequence, the converted digital value is a quarter of the V_{BAT} voltage.

3.34 Digital to analog converter (DAC)

The DAC module is a 12-bit, voltage output digital-to-analog converter. The DAC can be configured in 8- or 12-bit mode and may be used in conjunction with the DMA controller. In 12-bit mode, the data may be left- or right-aligned.

The DAC features two output channels, each with its own converter. In dual DAC channel mode, conversions can be done independently or simultaneously when both channels are grouped together for synchronous update operations. An input reference pin, VREF+ (shared with others analog peripherals) is available for better resolution. An internal reference can also be set on the same input.

The DAC_OUTx pin can be used as general purpose input/output (GPIO) when the DAC output is disconnected from output pad and connected to on chip peripheral. The DAC output buffer can be optionally enabled to allow a high drive output current. An individual calibration can be applied on each DAC output channel. The DAC output channels support a low-power mode, the sample and hold mode.

The digital interface supports the following features:

- One DAC interface, maximum two output channels
- Left or right data alignment in 12-bit mode
- Synchronized update capability
- Noise-wave and triangular-wave generation
- Sawtooth wave generation
- Dual DAC channel for independent or simultaneous conversions
- DMA capability for each channel including DMA underrun error detection
- Double data DMA capability to reduce the bus activity
- External triggers for conversion
- DAC output channel buffered/unbuffered modes
- Buffer offset calibration
- Each DAC output can be disconnected from the DAC_OUTx output pin

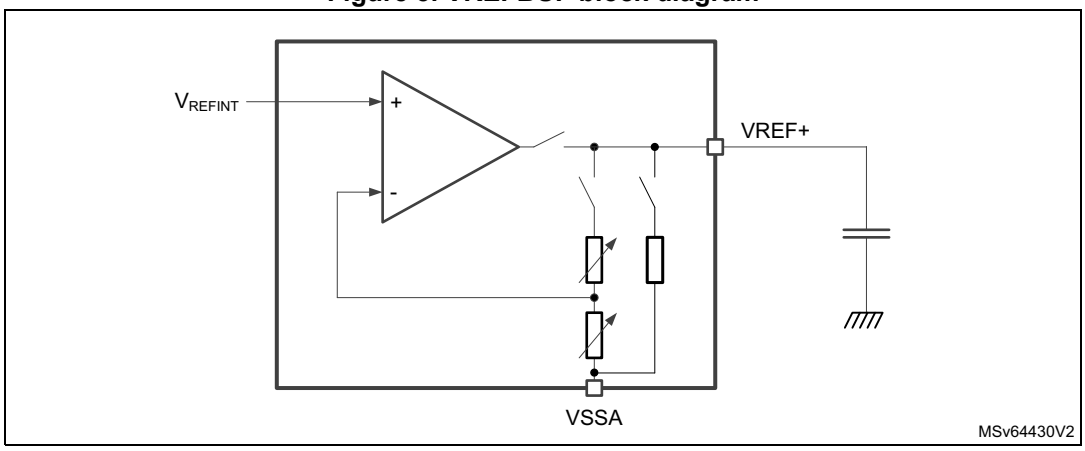
Downloaded from Arrow.com.

- DAC output connection to on chip peripherals
- Sample and hold mode for low-power operation in Stop mode. The DAC voltage can be changed autonomously with the DMA while the device is in Stop mode.
- Autonomous mode to reduce the power consumption for the system
- Voltage reference input

3.35 Voltage reference buffer (VREFBUF)

The devices embed a voltage reference buffer that can be used as voltage reference for ADCs, DACs and also as voltage reference for external components through the VREF+ pin.

Figure 5. VREFBUF block diagram



The internal voltage reference buffer supports four voltages: 1.5 V, 1.8 V, 2.048 V and 2.5 V.

An external voltage reference can be provided through the VREF+ pin when the internal voltage reference buffer is off.

The VREF+ pin is double-bonded with VDDA on some packages. In these packages the internal voltage reference buffer is not available.

3.36 Comparators (COMP)

The devices embed two rail-to-rail comparators with programmable reference voltage (internal or external), hysteresis and speed (low speed for low power) and with selectable output polarity.

The reference voltage can be one of the following:

- External I/O
- DAC output channels
- Internal reference voltage or submultiple (1/4, 1/2, 3/4)

All comparators can wake up from Stop 0, Stop 1 and Stop 2 modes, generate interrupts and breaks for the timers and can also be combined into a window comparator.

Downloaded from Arrow.com.

3.37 Operational amplifiers (OPAMP)

The devices embed two operational amplifiers with external or internal follower routing and PGA capability.

The operational amplifier features:

- Low-input bias current
- Low-offset voltage
- Low-power mode
- Rail-to-rail input

3.38 Multi-function digital filter (MDF) and audio digital filter (ADF)

The table below lists the set of features implemented into the MDF and the ADF.

Table 18. MDF features

MDF modes/features(1)	ADF1	MDF1
Number of filters (DFLTx) and serial interfaces (SITFx)	1	6
ADF_CKI0 / MDF_CKIy connected to pins	-	X
Sound activity detection (SAD)	X	-
RXFIFO depth (number of 24-bit words)	4	4
ADC connected to ADCITF1	-	ADC1
ADC connected to ADCITF2	-	ADC2
Motor dedicated features (SCD, OLD, OEC, INT, snapshot, break)	-	X
Main path with CIC4, CIC5	X	X
Main path with CIC1,2, 3 or FastSinc	-	X
RSFLT, HPF, SAT, SCALE, DLY, Discard functions	X	X
Autonomous in Stop mode	X(2)	X(3)

1. X = supported.
2. Stop 0, Stop 1 and Stop 2 modes only.
3. Stop 0 and Stop 1 modes only.

3.38.1 Multi-function digital filter (MDF)

The MDF is a high-performance module dedicated to the connection of external sigma-delta (ΣΔ) modulators. It is mainly targeted for the following applications:

- audio capture signals
- motor control
- metering

The MDF features six digital serial interfaces (SITFx) and digital filters (DFLTx) with flexible digital processing options to offer up to 24-bit final resolution.

The DFLTx of the MDF also include the filters of the ADF (audio digital filter).

The MDF can receive, via its serial interfaces, streams coming from various digital sensors.

Downloaded from Arrow.com.

The MDF supports the following standards allowing the connection of various ΣΔ modulator sensors:

- SPI interface
- Manchester coded 1-wire interface
- PDM interface

A flexible BSMX (bitstream matrix) allows the connection of any incoming bitstream to any filter.

The MDF converts an input data stream into clean decimated digital data words. This conversion is done thanks to low-pass digital filters and decimation blocks.In addition it is possible to insert a high-pass filter or DC offset correction block.

The conversion speed and resolution are adjustable according to configurable parameters for digital processing: filter type, filter order, decimation ratio, integrator length. The maximum output data resolution is up to 24 bits. There are two conversion modes: single conversion and continuous modes. The data can be automatically stored in a system RAM buffer through DMA, thus reducing the software overhead.

A flexible trigger interface can be used to control the conversion start. This timing control can trigger simultaneous conversions or insert a programmable delay between conversions.

The MDF features an OLD (out-off limit detectors) function. There is one OLD for each digital filter chain. Independent programmable thresholds are available for each OLD, making it very suitable for over-current detection.

A SCD (short circuit detector) is also available for every selected bitstream. The SCD is able to detect a short-circuit condition with a very short latency. Independent programmable thresholds are offered in order to define the short circuit condition.

All the digital processing is performed using only the kernel clock. The MDF requests the bus interface clock (AHB clock) only when data must be transfered or when a specific event requests the attention of the system processor.

The MDF main features are:

- AHB interface
- Six serial digital inputs:
  - configurable SPI interface to connect various digital sensors
  - configurable Manchester coded interface support
  - compatible with PDM interface to support digital microphones
- Two common clock input/output for ΣΔ modulators
- Flexible BSMX for connection between filters and digital inputs
- Two inputs to connect the internal ADCs
- Six flexible digital filter paths, including:
  - A configurable CIC filter:
    - Can be split into two CIC filters: high-resolution filter and out-off limit detector
    - Can be configured in $Sinc^4$ filter
    - Can be configured in $Sinc^5$ filter
    - Adjustable decimation ratio
  - A reshape filter to improve the out-off band rejection and in-band ripple
  - A high-pass filter to cancel the DC offset

Downloaded from Arrow.com.

  - An offset error cancellation
  - Gain control
  - Saturation blocks
  - An out-off limit detector
- Short-circuit detector
- Clock absence detector
- 16- or 24-bit signed output data resolution
- Continuous or single conversion
- Possibility to delay independently each bitstream
- Various trigger possibilities
- Break generation on out-of limit or short-circuit detector events
- Autonomous functionality in Stop modes
- DMA can be used to read the conversion data
- Interrupts services

3.38.2 Audio digital filter (ADF)

The ADF is a high-performance module dedicated to the connection of external ΣΔ modulators. It is mainly targeted for the following applications:

- audio capture signals
- metering

The ADF features one digital serial interface (SITF0) and one digital filter (DFLT0) with flexible digital processing options to offer up to 24-bit final resolution.

The DLFT0 of the ADF is a subset of the digital filters included into the MDF.

The ADF serial interface supports several standards allowing the connection of various ΣΔ modulator sensors:

- SPI interface
- Manchester coded 1-wire interface
- PDM interface

A flexible BSMX allows the connection of any incoming bitstream to any filter.

The ADF converts an input data stream into clean decimated digital data words. This conversion is done thanks to low-pass digital filters and decimation blocks. In addition it is possible to insert a high-pass filter or a DC offset correction block.

The conversion speed and resolution are adjustable according to configurable parameters for digital processing: filter type, filter order, decimation ratio. The maximum output data resolution is up to 24 bits. There are two conversion modes: single conversion and continuous modes. The data can be automatically stored in a system RAM buffer through DMA, thus reducing the software overhead.

A SAD (sound activity detector) is available for the detection of “speech-like” signals. The SAD is connected at the output of DFLT0. Several parameters can be programmed to adjust properly the SAD to the sound environment. The SAD can strongly reduce the power consumption by preventing the storage of samples into the system memory as long as the observed signal does not match the programmed criteria.

A flexible trigger interface can be used to control the start of conversion of the ADF.

Downloaded from Arrow.com.

All the digital processing is performed using only the kernel clock. The ADF requests the bus interface clock (AHB clock) only when data must be transfered or when a specific event requests the attention of the system processor.

The ADF main features are:

- AHB interface
- One serial digital inputs:
  - Configurable SPI interface to connect various digital sensors
  - Configurable Manchester coded interface support
  - Compatible with PDM interface to support digital microphones
- Two common clocks input/output for ΣΔ modulators
- Flexible BSMX for connection between filters and digital inputs
- One flexible digital filter paths, including:
  - A configurable CIC filter:
    - Can be configured in $Sinc^4$ filter
    - Can be configured in $Sinc^5$ filter
    - Adjustable decimation ratio
  - A reshape filter to improve the out-off band rejection and in-band ripple
  - A high-pass filter to cancel the DC offset
  - Gain control
  - Saturation blocks
- Clock absence detector
- Sound activity detector
- 16- or 24-bit signed output data resolution
- Continuous or single conversion
- Possibility to delay independently each bitstream
- Various trigger possibilities
- Autonomous mode in Stop 0, Stop 1 and Stop 2 modes
- Wake-up from Stop with all interrupts
- DMA can be used to read the conversion data
- Interrupts services

3.39 Digital camera interface (DCMI)

The digital camera is a synchronous parallel interface able to receive a high-speed data flow from an external 8-, 10-, 12-, or 14-bit CMOS camera module. It supports different data formats: YCbCr4:2:2/RGB565 progressive video and compressed data (JPEG).

This interface is for use with black and white cameras, X24 and X5 cameras, and it is assumed that all preprocessing such as resizing is performed in the camera module.

The DCMI features are:

- 8-, 10-, 12- or 14-bit parallel interface
- Embedded/external line and frame synchronization
- Continuous or snapshot mode

Downloaded from Arrow.com.

- Crop feature
- Supports the following data formats:
  - 8/10/12/14-bit progressive video: either monochrome or raw Bayer
  - YCbCr 4:2:2 progressive video
  - RGB 565 progressive video
  - Compressed data: JPEG

3.40 Parallel synchronous slave interface (PSSI)

The PSSI and the DCMI use the same circuitry. As a result, these two peripherals cannot be used at the same time: when using the PSSI, the DCMI registers cannot be accessed, and vice versa. In addition, the PSSI and the DCMI share the same alternate functions and the same interrupt vector.

The PSSI is a generic synchronous 8-/16-bit parallel data input/output slave interface. It enables the transmitter to send a data valid signal that indicates when the data is valid, and the receiver to output a flow control signal that indicates when it is ready to sample the data.

The PSSI peripheral main features are the following:

- Slave mode operation
- 8-bit or 16-bit parallel data input or output
- 4-word (16-byte) FIFO
- Data enable (PSSI_DE) alternate function input and ready (PSSI_RDY) alternate function output

When selected, these inputs can either enable the transmitter to indicate when the data is valid, or allow the receiver to indicate when it is ready to sample the data, or both.

3.41 LCD-TFT display controller (LTDC)

The LCD-TFT (liquid crystal display - thin film transistor) display controller provides a parallel digital RGB (Red, Green, Blue) and signals for horizontal/vertical synchronization, pixel clock and data enable as output to interface directly to a variety of LCD and TFT panels.

The LTDC main features are:

- 24-bit RGB parallel pixel output; 8 bits-per-pixel (RGB888)
- 2 display layers with dedicated FIFO (64x32-bit)
- Color look-up table (CLUT) up to 256 color (256x24-bit) per layer
- Programmable timings for different display panels
- Programmable background color
- Programmable polarity for HSYNC, VSYNC and data enable
- Up to 8 input color formats selectable per layer:
  - ARGB8888
  - RGB888
  - RGB565
  - ARGB1555

Downloaded from Arrow.com.

  - ARGB4444
  - L8 (8-bit luminance or CLUT)
  - AL44 (4-bit alpha + 4-bit luminance)
  - AL88 (8-bit alpha + 8-bit luminance)
- Pseudo-random dithering output for low bits per channel
  - Dither width 2 bits for Red, Green, Blue
- Flexible blending between two layers using alpha value (per pixel or constant)
- Color keying (transparency color)
- Programmable window position and size
- Supports thin film transistor (TFT) color displays
- AHB master interface with burst of 16 words
- Up to 4 programmable interrupt events

3.42 DSI Host controller (DSI)

The display serial interface (DSI) is part of a group of communication protocols defined by the MIPI Alliance. The MIPI DSI Host controller is a digital core that implements all protocol functions defined in the MIPI DSI specification. It provides an interface between the system (LTDC and APB interface) and the MIPI D-PHY, allowing the user to communicate with a DSI-compliant display.

The DSI main features are:

- Compliant with MIPI Alliance standards
- Interface with internal MIPI D-PHY
- Supports all commands defined in the MIPI Alliance specification for DCS:
  - Transmission of all command mode packets through the APB interface
  - Transmission of commands in low-power and high-speed during video mode
- Support of up to 2 D-PHY data lanes
- Bidirectional communication and escape mode support through data lane 0
- Support of non-continuous clock in D-PHY clock lane for additional power saving
- Support of ultra low-power mode with PLL disabled
- ECC and checksum capabilities
- Support for end of transmission packet (EoTp)
- Fault recovery schemes
- Configurable selection of system interfaces:
  - AMBA® APB for control and optional support for generic and DCS commands
  - Video mode interface through LTDC
  - Adapted command mode interface through LTDC
  - Independently programmable virtual channel ID in video mode, adapted command mode and APB slave
- Video mode interfaces features:
  - LTDC interface color coding mappings into 24-bit interface:
    - 16-bit RGB, configurations 1, 2, and 3
    - 18-bit RGB, configurations 1 and 2

Downloaded from Arrow.com.

- 24-bit RGB
  - Programmable polarity of all LTDC interface signals
  - Extended resolutions beyond the DPI standard maximum resolution of 800x480 pixels
  - Maximum resolution is limited by available DSI physical link bandwidth:
    - Number of lanes: 2
    - Maximum speed per lane: 500 Mbit/s
- Adapted interface features:
  - Support for sending large amounts of data through the memory_write_start (WMS) and memory_write_continue (WMC) DCS commands
  - LTDC interface color coding mappings into 24-bit interface:
    - 16-bit RGB, configurations 1, 2, and 3
    - 18-bit RGB, configurations 1 and 2
    - 24-bit RGB
- Video mode pattern generator:
  - Vertical and horizontal color bar generation without LTDC stimuli
  - BER pattern without LTDC stimuli

3.43 Touch sensing controller (TSC)

The TSC provides a simple solution to add capacitive sensing functionality to any application. A capacitive sensing technology is able to detect finger presence near an electrode that is protected from direct touch by a dielectric (such as glass or plastic). The capacitive variation introduced by the finger (or any conductive object) is measured using a proven implementation based on a surface charge transfer acquisition principle.

The TSC is fully supported by the STMTouch touch sensing firmware library that is free to use and allows touch sensing functionality to be implemented reliably in the end application.

The TSC main features are the following:

- Proven and robust surface charge transfer acquisition principle
- Supports up to 24 capacitive sensing channels
- Up to eight capacitive sensing channels can be acquired in parallel offering a very good response time
- Spread spectrum feature to improve system robustness in noisy environments
- Full hardware management of the charge transfer acquisition sequence
- Programmable charge transfer frequency
- Programmable sampling capacitor I/O pin
- Programmable channel I/O pin
- Programmable max count value to avoid long acquisition when a channel is faulty
- Dedicated end of acquisition and max count error flags with interrupt capability
- One sampling capacitor for up to three capacitive sensing channels to reduce the system components
- Compatible with proximity, touchkey, linear and rotary touch sensor implementation
- Designed to operate with STMTouch touch sensing firmware library

Downloaded from Arrow.com.

Note: The number of capacitive sensing channels is dependent on the size of the packages and subject to I/O availability.

3.44 True random number generator (RNG)

The RNG is a true random number generator that provides full entropy outputs to the application as 32-bit samples. It is composed of a live entropy source (analog) and an internal conditioning component.

The RNG is a NIST SP 800-90B compliant entropy source that can be used to construct a non-deterministic random bit generator (NDRBG).

The true random generator:

- delivers 32-bit true random numbers, produced by an analog entropy source conditioned by a NIST SP800-90B approved conditioning stage
- can be used as entropy source to construct a non-deterministic random bit generator (NDRBG)
- produces four 32-bit random samples every 412 AHB clock cycles if f_{AHB} < 77 MHz (256 RNG clock cycles otherwise)
- embeds startup and NIST SP800-90B approved continuous health tests (repetition count and adaptive proportion tests), associated with specific error management
- can be disabled to reduce power consumption, or enabled with an automatic low-power mode (default configuration)
- has an AMBA AHB slave peripheral, accessible through 32-bit word single accesses only (else an AHB bus error is generated, and the write accesses are ignored)

3.45 HASH hardware accelerator (HASH)

The HASH is a fully compliant implementation of the secure hash algorithm (SHA-1, SHA-224, SHA-256), the MD5 (message-digest algorithm 5) hash algorithm and the HMAC (keyed-hash message authentication code) algorithm. HMAC is suitable for applications requiring message authentication.

The HASH computes FIPS (Federal information processing standards) approved digests of length of 160, 224, 256 bits, for messages of up to (2^{64} – 1) bits. It also computes 128 bits digests for the MD5 algorithm.

The HASH main features are:

- Suitable for data authentication applications, compliant with:
  - Federal Information Processing Standards Publication FIPS PUB 180-4, *Secure Hash Standard* (SHA-1 and SHA-2 family)
  - Federal Information Processing Standards Publication FIPS PUB 186-4, *Digital* Signature Standard (DSS)
  - Internet Engineering Task Force (IETF) Request For Comments RFC 1321, *MD5* Message-Digest Algorithm
  - Internet Engineering Task Force (IETF) Request For Comments RFC 2104, *HMAC: Keyed-Hashing for Message Authentication* and Federal Information Processing Standards Publication FIPS PUB 198-1, *The Keyed-Hash Message* Authentication Code (HMAC)

Downloaded from Arrow.com.

- Fast computation of SHA-1, SHA-224, SHA-256, and MD5
  - 82 (respectively 66) clock cycles for processing one 512-bit block of data using SHA-1 (respectively SHA-256) algorithm
  - 66 clock cycles for processing one 512-bit block of data using MD5 algorithm
- Corresponding 32-bit words of the digest from consecutive message blocks are added to each other to form the digest of the whole message:
  - Automatic 32-bit words swapping to comply with the internal little-endian representation of the input bit string
  - Word swapping supported: bits, bytes, half-words and 32-bit words
- Automatic padding to complete the input bit string to fit digest minimum block size of 512 bits (16 × 32 bits)
- Single 32-bit input register associated to an internal input FIFO of sixteen 32-bit words, corresponding to one block size
- AHB slave peripheral, accessible through 32-bit word accesses only (else an AHB error is generated)
- 8 × 32-bit words (H0 to H7) for output message digest
- Automatic data flow control with support of direct memory access (DMA) using one channel. Single or fixed burst of 4 supported.
- Interruptible message digest computation, on a per-32-bit word basis
  - Re-loadable digest registers
  - Hashing computation suspend/resume mechanism, including using DMA

3.46 Timers and watchdogs

The devices include two advanced control timers, up to seven general-purpose timers, two basic timers, four low-power timers, two watchdog timers and two SysTick timers.

The table below compares the features of the advanced control, general-purpose and basic timers.

Table 19. Timer feature comparison

Timer type	Timer	Counter resolution	Counter type	Prescaler factor	DMA request generation	Capture/ compare channels	Complementary outputs
Advanced control	TIM1, TIM8	16 bits	Up, down, Up/down	Any integer between 1 and 65536	Yes	4	3
General-purpose	TIM2, TIM3, TIM4, TIM5	32 bits	Up, down, Up/down	Any integer between 1 and 65536	Yes	4	No
General-purpose	TIM15	16 bits	Up	Any integer between 1 and 65536	Yes	2	1

Downloaded from Arrow.com.

Table 19. Timer feature comparison (continued)

Timer type	Timer	Counter resolution	Counter type	Prescaler factor	DMA request generation	Capture/ compare channels	Complementary outputs
General-purpose	TIM16, TIM17	16 bits	Up	Any integer between 1 and 65536	Yes	1	1
Basic	TIM6, TIM7	16 bits	Up	Any integer between 1 and 65536	Yes	0	No

3.46.1 Advanced-control timers (TIM1, TIM8)

The advanced-control timers can each be seen as a three-phase PWM multiplexed on six channels. They have complementary PWM outputs with programmable inserted dead-times. They can also be seen as complete general-purpose timers.

The four independent channels can be used for:

- Input capture
- Output compare
- PWM generation (edge or center-aligned modes) with full modulation capability (0 - 100 %)
- One-pulse mode output

In Debug mode, the advanced-control timer counter can be frozen and the PWM outputs disabled in order to turn off any power switches driven by these outputs.

Many features are shared with the general-purpose TIMx timers (described in the next section) using the same architecture, so the advanced-control timers can work together with the TIMx timers via the *Timer Link* feature for synchronization or event chaining.

3.46.2 General-purpose timers (TIM2, TIM3, TIM4, TIM5, TIM15, TIM16,TIM17)

There are up to seven synchronizable general-purpose timers embedded in the STM32U5Fxxx devices (see *Table 19* for differences). Each general-purpose timer can be used to generate PWM outputs, or act as a simple time base.

- TIM2, TIM3, TIM4 and TIM5

  They are full-featured general-purpose timers with 32-bit auto-reload up/downcounter and 16-bit prescaler.

  These timers feature four independent channels for input capture/output compare, PWM or one-pulse mode output. They can work together, or with the other general-purpose timers via the *Timer Link* feature for synchronization or event chaining.

  The counters can be frozen in Debug mode.

  All have independent DMA request generation and support quadrature encoders.

Downloaded from Arrow.com.

- TIM15, 16 and 17

  They are general-purpose timers with mid-range features.

  They have 16-bit auto-reload upcounters and 16-bit prescalers.

  – TIM15 has two channels and one complementary channel
  – TIM16 and TIM17 have one channel and one complementary channel

  All channels can be used for input capture/output compare, PWM or one-pulse mode output.

  The timers can work together via the *Timer Link* feature for synchronization or event chaining. The timers have independent DMA request generation.

  The counters can be frozen in Debug mode.

3.46.3 Basic timers (TIM6 and TIM7)

The basic timers are mainly used for DAC trigger generation. They can also be used as generic 16-bit timebase.

3.46.4 Low-power timers (LPTIM1, LPTIM2, LPTIM3, LPTIM4)

The devices embed four low-power timers. These timers have an independent clock and are running in Stop mode if they are clocked by HSI16, MSI, LSE, LSI or an external clock. They are able to wake up the system from Stop mode.

LPTIM1, LPTIM3, and LPTIM4 are active in Stop 0, Stop 1 and Stop 2 modes.

LPTIM2 is active in Stop 0 and Stop 1 mode.

The low-power timer supports the following features:

- 16-bit up counter with 16-bit autoreload register
- 3-bit prescaler with eight possible dividing factors (1, 2, 4, 8, 16, 32, 64, 128)
- Selectable clock
  – Internal clock sources: LSE, LSI, HSI16, MSIK (LPTIM1, LPTIM3, LPTIM4 only) or APB clock (LPTIM2 only)
  – External clock source over LPTIM input (working with no LP oscillator running, used by *Pulse Counter* application)
- 16-bit ARR autoreload register
- 16-bit capture/compare register
- Continuous/One-shot mode
- Selectable software/hardware input trigger
- Programmable digital glitch filter
- Configurable output: pulse, PWM
- Configurable I/O polarity
- Encoder mode
- Repetition counter
- Up to 2 independent channels for:
  – Input capture
  – PWM generation (edge-aligned mode)
  – One-pulse mode output
- Interrupt generation on 10 events

Downloaded from Arrow.com.

- DMA request generation on the following events:
  - Update event
  - Input capture

3.46.5 Infrared interface (IRTIM)

An infrared interface (IRTIM) for remote control is available on the device. It can be used with an infrared LED to perform remote control functions. It uses internal connections with TIM16 and TIM17.

3.46.6 Independent watchdog (IWDG)

The independent watchdog is based on a 12-bit downcounter and a 8-bit prescaler. It is clocked from an independent 32 kHz internal RC (LSI) and, as it operates independently from the main clock, it can operate in Stop and Standby modes. It can be used either as a watchdog to reset the device when a problem occurs, or as a free running timer for application timeout management. It is hardware or software configurable through the option bytes. The counter can be frozen in Debug mode.

3.46.7 Window watchdog (WWDG)

The window watchdog is based on a 7-bit downcounter that can be set as free running. It can be used as a watchdog to reset the device when a problem occurs. It is clocked from the main clock. It has an early warning interrupt capability and the counter can be frozen in Debug mode.

3.46.8 SysTick timer

The Cortex-M33 with TrustZone embeds two SysTick timers.

When TrustZone is activated, two SysTick timer are available:

- SysTick, secure instance
- SysTick, nonsecure instance

When TrustZone is disabled, only one SysTick timer is available. This timer (secure or non-secure) is dedicated to real-time operating systems, but can also be used as a standard down counter. It features:

- A 24-bit down counter
- Autoreload capability
- Maskable system interrupt generation when the counter reaches 0
- Programmable clock source.

3.47 Real-time clock (RTC), tamper and backup registers

3.47.1 Real-time clock (RTC)

The RTC supports the following features:

- Calendar with subsecond, seconds, minutes, hours (12 or 24 format), weekday, date, month, year, in BCD (binary-coded decimal) format
- Binary mode with 32-bit free-running counter

Downloaded from Arrow.com.

- Automatic correction for 28, 29 (leap year), 30, and 31 days of the month
- Two programmable alarms
- On-the-fly correction from 1 to 32767 RTC clock pulses. This can be used to synchronize it with a master clock
- Reference clock detection: a more precise second source clock (50 or 60 Hz) can be used to enhance the calendar precision
- Digital calibration circuit with 0.95 ppm resolution, to compensate for quartz crystal inaccuracy
- Timestamp feature that can be used to save the calendar content. This function can be triggered by an event on the timestamp pin, or by a tamper event, or by a switch to V_{BAT} mode
- 17-bit auto-reload wake-up timer (WUT) for periodic events with programmable resolution and period
- TrustZone support:
  - RTC fully securable
  - Alarm A, alarm B, wake-up timer and timestamp individual secure or nonsecure configuration
  - Alarm A, alarm B, wake-up timer and timestamp individual privileged protection

The RTC is supplied through a switch that takes power either from the V_{DD} supply when present or from the VBAT pin.

The RTC clock sources can be one of the following:

- 32.768 kHz external crystal (LSE)
- external resonator or oscillator (LSE)
- internal low-power RC oscillator (LSI, with typical frequency of 32 kHz)
- high-speed external clock (HSE), divided by a prescaler in the RCC.

The RTC is functional in V_{BAT} mode and in all low-power modes when it is clocked by the LSE. When clocked by the LSI, the RTC is not functional in V_{BAT} mode, but is functional in all low-power modes except Shutdown mode.

All RTC events (alarm, wake-up timer, timestamp) can generate an interrupt and wake-up the device from the low-power modes.

3.47.2 Tamper and backup registers (TAMP)

The anti-tamper detection circuit is used to protect sensitive data from external attacks. 32 32-bit backup registers are retained in all low-power modes and also in V_{BAT} mode. The backup registers, as well as other secrets in the device, are protected by this anti-tamper detection circuit with eight tamper pins and eleven internal tampers. The external tamper pins can be configured for edge detection, or level detection with or without filtering, or active tamper that increases the security level by auto checking that the tamper pins are not externally opened or shorted.

TAMP main features:

- A tamper detection can erase the backup registers, backup SRAM, SRAM2, caches and cryptographic peripherals.
- 32 32-bit backup registers:
  - The backup registers (TAMP_BKPxR) are implemented in the Backup domain that remains powered-on by V_{BAT} when the V_{DD} power is switched off.

Downloaded from Arrow.com.

- Up to 8 tamper pins for 8 external tamper detection events:
  - Active tamper mode: continuous comparison between tamper output and input to protect from physical open-short attacks
  - Flexible active tamper I/O management: from 4 meshes (each input associated to its own exclusive output) to 7 meshes (single output shared for up to 7 tamper inputs)
  - Passive tampers: ultra-low-power edge or level detection with internal pull-up hardware management
  - Configurable digital filter
- 11 internal tamper events to protect against transient or environmental perturbation attacks:
  - Backup domain voltage monitoring
  - Temperature monitoring
  - LSE monitoring
  - RTC calendar overflow
  - JTAG/SWD access if RDP different from 0
  - Monotonic counter overflow
  - Cryptographic peripherals fault (RNG)
  - Independent watchdog reset when tamper flag is already set
  - 3 ADC4 watchdogs
- Each tamper can be configured in two modes:
  - Hardware mode: immediate erase of secrets on tamper detection, including backup registers erase
  - Software mode: erase of secrets following a tamper detection launched by software
- Any tamper detection can generate a RTC time stamp event.
- TrustZone support:
  - Tamper secure or nonsecure configuration
  - Backup registers configuration in 3 configurable-size areas:
    - 1 read/write secure area
    - 1 write secure/read nonsecure area
    - 1 read/write nonsecure area
- Tamper configuration and backup registers privilege protection
- Monotonic counter

3.48 Inter-integrated circuit interface (I2C)

The device embeds six I2C. Refer to *Table 20* for the features implementation.

The I^2C bus interface handles communications between the microcontroller and the serial I^2C bus. It controls all I^2C bus-specific sequencing, protocol, arbitration and timing.

The I2C peripheral supports:

- I^2C-bus specification and user manual rev. 5 compatibility:
  - Controller and target modes, multicontroller capability

Downloaded from Arrow.com.

  - Standard-mode (Sm), with a bit rate up to 100 Kbit/s
  - Fast-mode (Fm), with a bit rate up to 400 Kbit/s
  - Fast-mode Plus (Fm+), with a bit rate up to 1 Mbit/s and 20 mA output drive I/Os
  - 7-bit and 10-bit addressing mode, multiple 7-bit target addresses
  - Programmable setup and hold times
  - Optional clock stretching
- System management bus (SMBus) specification rev 3.0 compatibility:
  - Hardware PEC (packet error checking) generation and verification with ACK control
  - Address resolution protocol (ARP) support
  - SMBus alert
- Power system management protocol (PMBus) specification rev 1.3 compatibility
- Independent clock: a choice of independent clock sources allowing the I2C communication speed to be independent from the PCLK reprogramming
- Autonomous functionality in Stop modes with wake-up from Stop capability
- Programmable analog and digital noise filters
- 1-byte buffer with DMA capability

Table 20. I2C implementation

I2C features(1)	I2C1	I2C2	I2C3	I2C4	I2C5	I2C6
Standard-mode (up to 100 Kbit/s)	X	X	X	X	X	X
Fast-mode (up to 400 Kbit/s)	X	X	X	X	X	X
Fast-mode Plus with 20 mA output drive I/Os (up to 1 Mbit/s)	X	X	X	X	X	X
Programmable analog and digital noise filters	X	X	X	X	X	X
SMBus/PMBus hardware support	X	X	X	X	X	X
Independent clock	X	X	X	X	X	X
Autonomous in Stop 0, Stop 1 mode with wake-up capability	X	X	X	X	X	X
Autonomous in Stop 2 mode with wake-up capability	-	-	X	-	-	-

1. X: supported

3.49 Universal synchronous/asynchronous receiver transmitter (USART/UART) and low-power universal asynchronous receiver transmitter (LPUART)

The devices embed four universal synchronous receiver transmitters (USART1, USART2, USART3 and USART6), two universal asynchronous receiver transmitters (UART4, UART5) and one low-power universal asynchronous receiver transmitter (LPUART1).

Downloaded from Arrow.com.

Table 21. USART, UART, and LPUART features

USART modes/features(1)	USART1/2/3/6	UART4/5	LPUART1
Hardware flow control for modem	X	X	X
Continuous communication using DMA	X	X	X
Multiprocessor communication	X	X	X
Synchronous SPI mode (master/slave)	X	-	-
Smartcard mode	X	-	-
Single-wire half-duplex communication	X	X	X
IrDA SIR ENDEC block	X	X	-
LIN mode	X	X	-
Dual-clock domain and wake-up from Stop mode	X(2)	X(2)	X(3)
Receiver timeout interrupt	X	X	-
Modbus communication	X	X	-
Auto-baud rate detection	X	X	-
Driver enable	X	X	X
USART data length	7, 8 and 9 bits		
Tx/Rx FIFO	X	X	X
Tx/Rx FIFO size	8 bytes		
Autonomous mode	X	X	X

1. X = supported.
2. Wake-up supported from Stop 0 and Stop 1 modes.
3. Wake-up supported from Stop 0, Stop 1 and Stop 2 modes.

3.49.1 Universal synchronous/asynchronous receiver transmitter (USART/UART)

The USART offers a flexible means to perform full-duplex data exchange with external equipments requiring an industry standard NRZ asynchronous serial data format. A very wide range of baud rates can be achieved through a fractional baud rate generator.

The USART supports both synchronous one-way and half-duplex single-wire communications, as well as LIN (local interconnection network), Smartcard protocol, IrDA (infrared data association) SIR ENDEC specifications, and modem operations (CTS/RTS). Multiprocessor communications are also supported.

High-speed data communications up to 20 Mbauds are possible by using the DMA (direct memory access) for multibuffer configuration.

The USART main features are:

- Full-duplex asynchronous communication
- NRZ standard format (mark/space)
- Configurable oversampling method by 16 or 8 to achieve the best compromise between speed and clock tolerance
- Baud rate generator systems

Downloaded from Arrow.com.

- Two internal FIFOs for transmit and receive data
  Each FIFO can be enabled/disabled by software and come with a status flag.
- A common programmable transmit and receive baud rate
- Dual-clock domain with dedicated kernel clock for peripherals independent from PCLK
- Auto baud rate detection
- Programmable data word length (7, 8 or 9 bits)
- Programmable data order with MSB-first or LSB-first shifting
- Configurable stop bits (1 or 2 stop bits)
- Synchronous SPI master/slave mode and clock output/input for synchronous communications
- SPI slave transmission underrun error flag
- Single-wire half-duplex communications
- Continuous communications using DMA
- Received/transmitted bytes are buffered in reserved SRAM using centralized DMA
- Separate enable bits for transmitter and receiver
- Separate signal polarity control for transmission and reception
- Swappable Tx/Rx pin configuration
- Hardware flow control for modem and RS-485 transceiver
- Communication control/error detection flags
- Parity control:
  - Transmits parity bit
  - Checks parity of received data byte
- Interrupt sources with flags
- Multiprocessor communications: wake-up from Mute mode by idle line detection or address mark detection
- Autonomous functionality in Stop mode with wake-up from stop capability
- LIN master synchronous break send capability and LIN slave break detection capability
  - 13-bit break generation and 10/11-bit break detection when USART is hardware configured for LIN
- IrDA SIR encoder decoder supporting 3/16-bit duration for Normal mode
- Smartcard mode
  - Supports the T=0 and T=1 asynchronous protocols for smartcards as defined in the ISO/IEC 7816-3 standard
  - 0.5 and 1.5 stop bits for Smartcard operation
- Support for Modbus communication
  - Timeout feature
  - CR/LF character recognition

3.49.2 Low-power universal asynchronous receiver transmitter (LPUART)

The LPUART supports bidirectional asynchronous serial communication with minimum power consumption. It also supports half-duplex single-wire communication and modem operations (CTS/RTS). It allows multiprocessor communication.

Downloaded from Arrow.com.

Only a 32.768 kHz clock (LSE) is needed to allow LPUART communication up to 9600 baud. Therefore, even in Stop mode, the LPUART can wait for an incoming frame while having an extremely low energy consumption. Higher-speed clock can be used to reach higher baudrates.

The LPUART interface can be served by the DMA controller.

The LPUART main features are:

- Full-duplex asynchronous communications
- NRZ standard format (mark/space)
- Programmable baud rate
- From 300 baud/s to 9600 baud/s using a 32.768 kHz clock source
- Higher baud rates can be achieved by using a higher frequency clock source
- Two internal FIFOs to transmit and receive data
  Each FIFO can be enabled/disabled by software and come with status flags for FIFO states.
- Dual-clock domain with dedicated kernel clock for peripherals independent from PCLK
- Programmable data word length (7 or 8 or 9 bits)
- Programmable data order with MSB-first or LSB-first shifting
- Configurable stop bits (1 or 2 stop bits)
- Single-wire half-duplex communications
- Continuous communications using DMA
- Received/transmitted bytes are buffered in reserved SRAM using centralized DMA
- Separate enable bits for transmitter and receiver
- Separate signal polarity control for transmission and reception
- Swappable Tx/Rx pin configuration
- Hardware flow control for modem and RS-485 transceiver
- Transfer detection flags:
  - Receive buffer full
  - Transmit buffer empty
  - Busy and end of transmission flags
- Parity control:
  - Transmits parity bit
  - Checks parity of received data byte
- Four error detection flags:
  - Overrun error
  - Noise detection
  - Frame error
  - Parity error
- Interrupt sources with flags
- Multiprocessor communications: wake-up from Mute mode by idle line detection or address mark detection
- Autonomous functionality in Stop mode with wake-up from Stop capability

Downloaded from Arrow.com.

3.50 Serial peripheral interfaces (SPI)

The devices embed three serial peripheral interfaces (SPI) that can be used to communicate with external devices while using the specific synchronous protocol. The SPI protocol supports half-duplex, full-duplex and simplex synchronous, serial communication with external devices.

The interface can be configured as master or slave and can operate in multi-slave or multi-master configurations. The device configured as master provides communication clock (SCK) to the slave device. The slave select (SS) and ready (RDY) signals can be applied optionally just to setup communication with concrete slave and to assure it handles the data flow properly. The Motorola® data format is used by default, but some other specific modes are supported as well.

The SPI main features are:

- Full-duplex synchronous transfers on three lines
- Half-duplex synchronous transfer on two lines (with bidirectional data line)
- Simplex synchronous transfers on two lines (with unidirectional data line)
- 4-bit to 32-bit data size selection or fixed to 8-bit and 16-bit only
- Multi master or multi slave mode capability
- Dual-clock domain, separated clock for the peripheral kernel that can be independent of PCLK
- Baud rate prescaler up to kernel frequency/2 or bypass from RCC in Master mode
- Protection of configuration and setting
- Hardware or software management of SS for both master and slave
- Adjustable minimum delays between data and between SS and data flow
- Configurable SS signal polarity and timing, MISO x MOSI swap capability
- Programmable clock polarity and phase
- Programmable data order with MSB-first or LSB-first shifting
- Programmable number of data within a transaction to control SS and CRC
- Dedicated transmission and reception flags with interrupt capability
- SPI Motorola® and Texas Instruments® formats support
- Hardware CRC feature can secure communication at the end of transaction by:
  - Adding CRC value in Tx mode
  - Automatic CRC error checking for Rx mode
- Error detection with interrupt capability in case of data overrun, CRC error, data underrun at slave, mode fault at master
- Two 16x or 8x 8-bit embedded Rx and TxFIFOs with DMA capability
- Programmable number of data in transaction
- Configurable FIFO thresholds (data packing)
- Configurable behavior at slave underrun condition (support of cascaded circular buffers)
- Autonomous functionality in Stop modes (handling of the transaction flow and required clock distribution) with wake-up from stop capability
- Optional status pin RDY signalizing the slave device ready to handle the data flow.

Downloaded from Arrow.com.

Table 22. SPI features

SPI feature	SPI1, SPI2 (full feature set instances)	SPI3 (limited feature set instance)
Data size	Configurable from 4 to 32-bit	8/16-bit
CRC computation	CRC polynomial length configurable from 5 to 33-bit	CRC polynomial length configurable from 9 to 17-bit
Size of FIFOs	16x 8-bit	8x 8-bit
Number of transfered data	Unlimited, expandable	Up to 1024, no data counter
Autonomous in Stop 0, Stop 1 mode with wake-up capability	Yes	Yes
Autonomous in Stop 2 mode with wake-up capability	No	Yes

3.51 Serial audio interfaces (SAI)

The devices embed two SAI. Refer to *Table 23: SAI implementation* for the features implementation. The SAI bus interface handles communications between the microcontroller and the serial audio protocol.

The SAI peripheral supports:

- Two independent audio sub-blocks that can be transmitters or receivers with their respective FIFO
- 8-word integrated FIFOs for each audio sub-block
- Synchronous or Asynchronous mode between the audio sub-blocks
- Master or slave configuration independent for both audio sub-blocks
- Clock generator for each audio block to target independent audio frequency sampling when both audio sub-blocks are configured in master mode
- Data size configurable: 8-, 10-, 16-, 20-, 24-, 32-bit
- Peripheral with large configurability and flexibility allowing to target as example the following audio protocol: I2S, LSB or MSB-justified, PCM/DSP, TDM, AC’97 and SPDIF out
- Up to 16 slots available with configurable size and with the possibility to select which ones are active in the audio frame
- Number of bits by frame may be configurable
- Frame synchronization active level configurable (offset, bit length, level)
- First active bit position in the slot is configurable
- LSB first or MSB first for data transfer
- Mute mode
- Stereo/mono audio frame capability
- Communication clock strobing edge configurable (SCK)
- Error flags with associated interrupts if enabled respectively
  - Overrun and underrun detection
  - Anticipated frame synchronization signal detection in Slave mode
  - Late frame synchronization signal detection in Slave mode

Downloaded from Arrow.com.

  - Codec not ready for the AC’97 mode in reception
- Interruption sources when enabled:
  - Errors
  - FIFO requests
- DMA interface with two dedicated channels to handle access to the dedicated integrated FIFO of each SAI audio sub-block.

Table 23. SAI implementation

SAI features(1)	SAI1	SAI2
I2S, LSB or MSB-justified, PCM/DSP, TDM, AC’97	X	X
Mute mode	X	X
Stereo/mono audio frame capability.	X	X
16 slots	X	X
Data size configurable: 8-, 10-, 16-, 20-, 24-, 32-bit	X	X
FIFO size	X (8 words)	X (8 words)
SPDIF	X	X
PDM	X	-

1. X: supported

3.52 Secure digital input/output and MultiMediaCards interface (SDMMC)

The SDMMC (SD/SDIO embedded MultiMediaCard *e*•MMC™ host interface) provides an interface between the AHB bus and SD memory cards, SDIO cards and *e*•MMC devices.

The MultiMediaCard system specifications are available through the MultiMediaCard association website at www.mmca.org, published by the MMCA technical committee.

SD memory card and SD I/O card system specifications are available through the SD card Association website at www.sdcard.org.

Downloaded from Arrow.com.

The SDMMC features include the following:

- Compliance with Embedded MultiMediaCard System Specification Version 5.1
  Card support for three different databus modes: 1-bit (default), 4-bit and 8-bit
  (HS200 SDMMC_CK speed limited to maximum allowed I/O speed) (HS400 is not supported).
- Full compatibility with previous versions of MultiMediaCards (backward compatibility).
- Full compliance with *SD memory card specifications version 6.0*
  (SDR104 SDMMC_CK speed limited to maximum allowed I/O speed, SPI mode and UHS-II mode not supported).
- Full compliance with *SDIO card specification version 4.0*
  Card support for two different databus modes: 1-bit (default) and 4-bit
  (SDR104 SDMMC_CK speed limited to maximum allowed I/O speed, SPI mode and UHS-II mode not supported).
- Data transfer up to 208 Mbyte/s for the 8-bit mode
  (Depending maximum allowed I/O speed).
- Data and command output enable signals to control external bidirectional drivers
- IDMA linked list support

The MultiMediaCard/SD bus connects cards to the host.

The current version of the SDMMC supports only one SD/SDIO/*e*•MMC card at any one time and a stack of *e*•MMC.

Table 24. SDMMC features

SDMMC modes/features[1]	SDMMC1	SDMMC2
Variable delay (SDR104, HS200)	X	X
SDMMC_CKIN	X	-
SDMMC_CDIR, SDMMC_D0DIR	X	-
SDMMC_D123DIR	X	-

1. X = supported.

When SDMMC peripherals are used simultaneously:

- Only one can be used in *e*•MMC with 8-bit bus width.
- The SDMMC1 SDIO voltage switch use is mutually exclusive with SDMMC2 interfacing *e*•MMC with 8-bit bus width, as follows:
  - If SDMMC1 has to support SDIO UHS-I modes (SDR12, SDR25, SDR50, SDR104 or DDR50), SDMMC2 cannot support *e*•MMC with 8-bit bus width.
  - if SDMMC2 has to support *e*•MMC with 8-bit bus width, SDMMC1 supports only SDIO default mode and high-speed mode.

3.53 USB on-the-go high-speed (OTG_HS)

The devices embed an USB OTG high-speed device/host/OTG peripheral with integrated transceivers. The USB OTG_HS peripheral is compliant with the USB 2.0 specification and

Downloaded from Arrow.com.

with the OTG 2.0 specification. It has software-configurable endpoint setting and supports suspend/resume.

This interface requires a precise 60 MHz clock that is generated from the internal USB PHY PLL (the clock source must use a HSE crystal oscillator).

The OTG_HS features are:

- USB-IF certified to the Universal Serial Bus Specification Rev 2.0
- On-chip high-speed PHY
- Full support (PHY) for the optional OTG (on-the-go) protocol detailed in the OTG Supplement Rev 2.0 specification
  - Integrated support for A-B device identification (ID line)
  - Integrated support for host negotiation protocol (HNP) and session request protocol (SRP)
  - Allows host to turn V_{BUS} off to conserve battery power in OTG applications
  - Supports OTG monitoring of V_{BUS} levels with internal comparators
  - Supports dynamic host-peripheral switch of role
- Software-configurable to operate as:
  - SRP capable USB HS/FS peripheral (B-device)
  - SRP capable USB HS/FS/LS host (A-device)
  - USB on-the-go high-speed dual role device
- Supports HS/FS SOF and LS keep-alives with
  - SOF pulse PAD connectivity
  - SOF pulse internal connection to timer (TIMx)
  - Configurable framing period
  - Configurable end of frame interrupt
- USB 2.0 link power management (LPM) support
- Internal DMA with thresholding support and software selectable AHB burst type in DMA mode
- Power saving features such as system stop during USB suspend, switch-off of clock domains internal to the digital core, PHY and DFIFO power management
- Dedicated RAM of 4 Kbytes with advanced FIFO control:
  - Configurable partitioning of RAM space into different FIFOs for flexible and efficient use of RAM
  - Each FIFO able to hold multiple packets
  - Dynamic memory allocation
  - Configurable FIFO sizes that are not powers of two to allow the use of contiguous memory locations
- Max guaranteed USB bandwidth for up to one frame (1 ms) without system intervention
- Support of charging port detection as described in *Battery Charging Specification* revision 1.2

Host-mode features:

- External charge pump for VBUS voltage generation
- Up to 16 host channels (pipes): each channel is dynamically reconfigurable to allocate any type of USB transfer

Downloaded from Arrow.com.

- Built-in hardware scheduler holding:
  - Up to 16 interrupt plus isochronous transfer requests in the periodic hardware queue
  - Up to 16 control plus bulk transfer requests in the non-periodic hardware queue
- Management of a shared Rx FIFO, a periodic Tx FIFO and a non periodic Tx FIFO for efficient usage of the USB data RAM

Peripheral-mode features:

- 1 bidirectional control endpoint0
- 8 IN endpoints (EPs) configurable to support bulk, interrupt or isochronous transfers
- 8 OUT endpoints configurable to support bulk, interrupt or isochronous transfers
- Management of a shared Rx FIFO and a Tx-OUT FIFO for efficient usage of the USB data RAM
- Management of up to 9 dedicated Tx-IN FIFOs (one for each active IN EP) to put less load on the application
- Support for the soft disconnect feature

3.54 USB Type-C /USB Power Delivery controller (UCPD)

The device embeds one controller (UCPD) compliant with USB Type-C Cable and Connector Specification release 2.0 and USB Power Delivery Rev. 3.0 specifications.

The controller uses specific I/Os supporting the USB Type-C and USB power delivery requirements, featuring:

- USB Type-C pull-up (Rp, all values) and pull-down (Rd) resistors
- “Dead battery” support
- USB power delivery message transmission and reception
- FRS (fast role swap) support

The digital controller handles notably:

- USB Type-C level detection with debounce, generating interrupts
- FRS detection, generating an interrupt
- Byte-level interface for USB power delivery payload, generating interrupts (DMA compatible)
- USB power delivery timing dividers (including a clock prescaler)
- CRC generation/checking
- 4b5b encode/decode
- Ordered sets (with a programmable ordered set mask at receive)
- Frequency recovery in receiver during preamble

The interface offers low-power operation compatible with Stop mode, maintaining the capacity to detect incoming USB power delivery messages and FRS signaling.

Downloaded from Arrow.com.

3.55 Development support

3.55.1 Serial-wire/JTAG debug port (SWJ-DP)

The Arm SWJ-DP interface is embedded and is a combined JTAG and serial-wire debug port that enables either a serial wire debug or a JTAG probe to be connected to the target.

Debug is performed using two pins only instead of five required by the JTAG (JTAG pins can be re-used as GPIO with alternate function): the JTAG TMS and TCK pins are shared with SWDIO and SWCLK, respectively, and a specific sequence on the TMS pin is used to switch between JTAG-DP and SW-DP.

3.55.2 Embedded Trace Macrocell

The Arm Embedded Trace Macrocell (ETM) provides a greater visibility of the instruction and data flow inside the CPU core by streaming compressed data at a very high rate from the devices through a small number of ETM pins to an external hardware trace port analyzer (TPA) device.

Real-time instruction and data flow activity be recorded and then formatted for display on the host computer that runs the debugger software. TPA hardware is commercially available from common development tool vendors.

The ETM operates with third party debugger software tools.

4.2 Pin description

Table 25. Legend/abbreviations used in the pinout table

Name		Abbreviation	Definition
Pin name		Unless otherwise specified in brackets below the pin name, the pin function during and after reset is the same as the actual pin name	
Pin type		S	Supply pin
		I	Input only pin
		I/O	Input/output pin
I/O structure		FT	5V-tolerant I/O
		TT	3.6V-tolerant I/O
		DSI	1.2 V I/O for DSI interface
		RST	Bidirectional reset pin with embedded weak pull-up resistor
		Option for TT or FT I/Os(1)	
		_a	I/O, with analog switch function supplied by V_{DDA}
		_c	I/O with USB Type-C power delivery function
		_d	I/O with USB Type-C power delivery dead battery function
		_f	I/O, Fm+ capable
		_h	I/O with high-speed low-voltage mode
		_o	I/O with OSC32_IN/OSC32_OUT capability
		_p	I/O with differential clock capability CLKP/CLKN
		_s	I/O supplied only by V_{DDIO2}
		_t	I/O with a function supplied by V_{SW}
		_u	I/O with USB function supplied by V_{DDUSB}
		_v	I/O very high-speed capable
Notes		Unless otherwise specified by a note, all I/Os are set as analog inputs during and after reset.	
Pin functions	Alternate functions	Functions selected through GPIOx_AFR registers	
	Additional functions	Functions directly selected/enabled through peripheral registers	

1. The related I/O structures in the table below are a concatenation of various options. Examples: FT_hat, FT_fs, FT_u, TT_a.

Downloaded from Arrow.com.

1. Function availability depends on the chosen device.
2. PC13, PC14, and PC15 are supplied through the power switch (by V_{SW}). Since the switch only sinks a limited amount of current (3 mA), the use of PC13 to PC15 GPIOs in output mode is limited:
   - PC13 speed must not exceed 2 MHz with a maximum load of 30 pF. Refer to FT_o electrical characteristics for PC14, PC15.
   - These GPIOs must not be used as current sources (for example to drive a LED).
3. After a backup domain power-up, PC13, PC14, and PC15 operate as GPIOs. Their function depends then on the content of the RTC registers that are not reset by the system reset. For details on how to manage these GPIOs, refer to the backup domain and RTC register descriptions in the product reference manual.
4. After reset, a pull-down resistor (Rd = 5.1 kΩ from UCPD peripheral) can be activated on PA15 and PB15 (UCPD1_CC1, UCPD1_CC2). The pull-down on PA15 (UCPD1_CC1) is activated by high level on PB5 (UCPD1_DBCC1). The pull-down on PB15 (UCPD1_CC2) is activated by high level on PB14 (UCPD1_DBCC2). This pull-down control (dead battery support on UCPD) can be disabled by setting UCPD_DBDIS = 1 in the PWR_UCPDR register.
5. GPIO is 5V-tolerant when the USB PHY is powered on.
6. After reset, this pin is configured as JTAG/SWD alternate functions. The internal pull-up on PA15, PA13, PB4 pins, and the internal pull-down on PA14 pin are activated.

5 Electrical characteristics

5.1 Parameter conditions

Unless otherwise specified, all voltages are referenced to V_{SS}.

5.1.1 Minimum and maximum values

Unless otherwise specified, the minimum and maximum values are guaranteed in the worst conditions of ambient temperature, supply voltage, and frequencies by tests in production on 100% of the devices with an ambient temperature at T_A = 25 °C and T_A = $T_A$max (given by the selected temperature range).

Data based on characterization results, design simulation and/or technology characteristics are indicated in the table footnotes, and are not tested in production. Based on characterization, the minimum and maximum values refer to sample tests and represent the mean value plus or minus three times the standard deviation (mean ±3σ).

5.1.2 Typical values

Unless otherwise specified, typical data are based on T_A = 25 °C, V_{DD} = V_{DDA} = 3 V. They are given only as design guidelines and are not tested.

Typical ADC accuracy values are determined by characterization of a batch of samples from a standard diffusion lot over the full temperature range, where 95% of the devices have an error less than or equal to the value indicated (mean ±2σ).

5.1.3 Typical curves

Unless otherwise specified, all typical curves are given only as design guidelines and are not tested.

5.1.4 Loading capacitor

The loading conditions used for pin parameter measurement are shown in *Figure 13*.

5.1.5 Pin input voltage

The input voltage measurement on a pin of the device is described in *Figure 14*.

Figure 13. Pin loading conditions

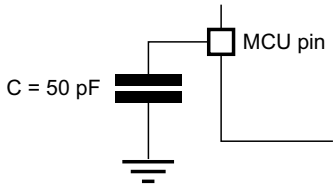

Figure 14. Pin input voltage

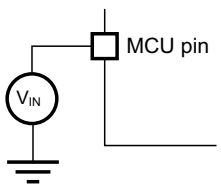


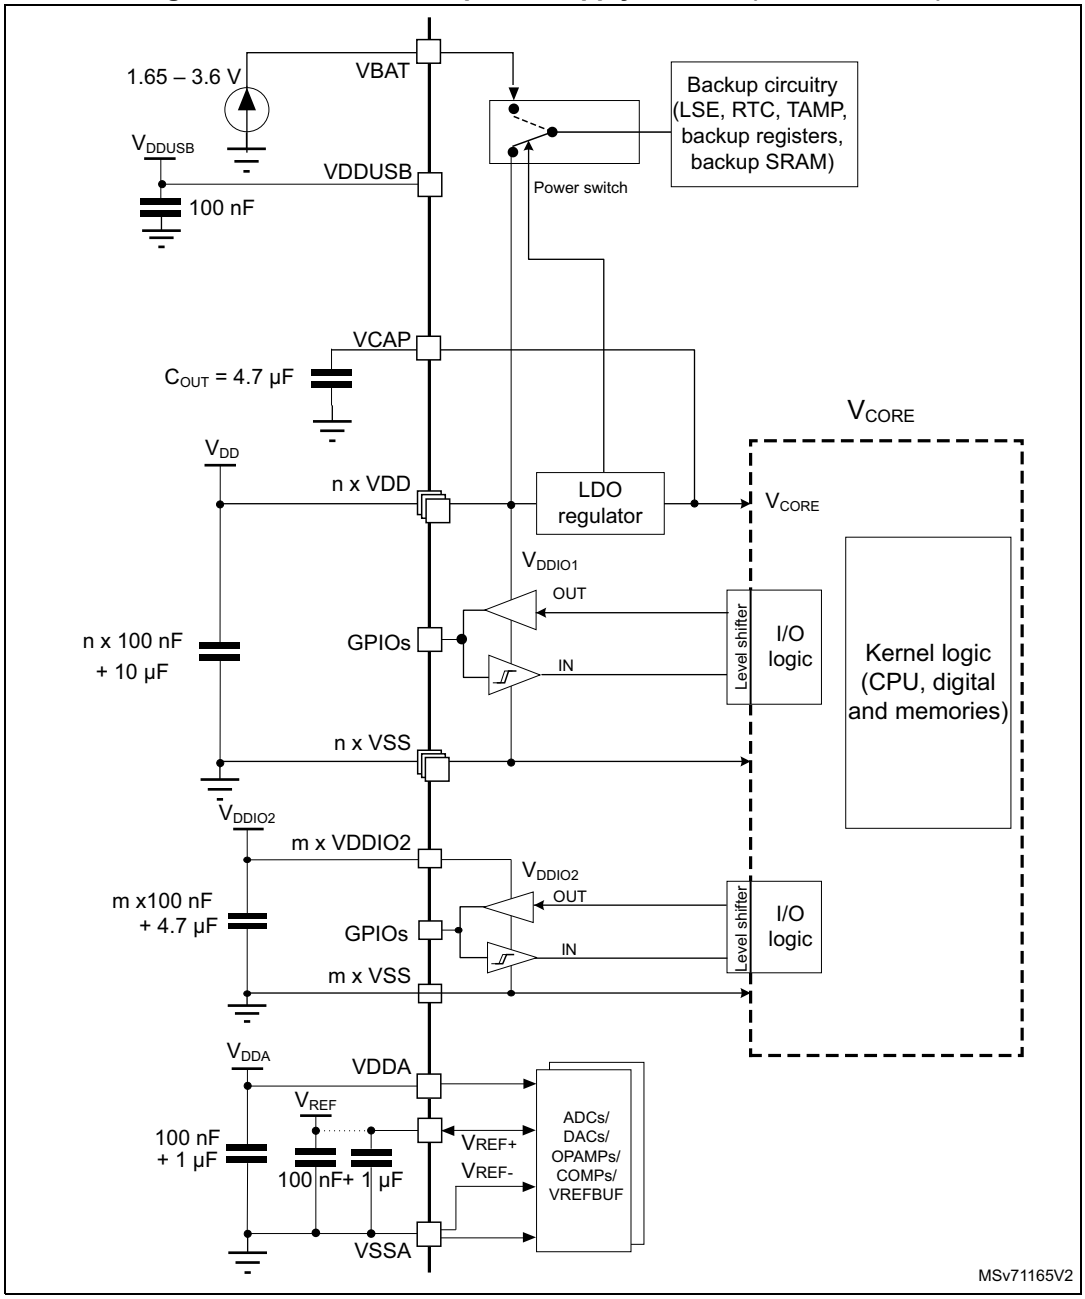
5.1.6 Power supply scheme

Each power supply pair (such as V_{DD}/V_{SS} or V_{DDA}/V_{SSA}) must be decoupled with filtering ceramic capacitors as shown in *Figure 15* and *Figure 16*. These capacitors must be placed

Downloaded from Arrow.com.

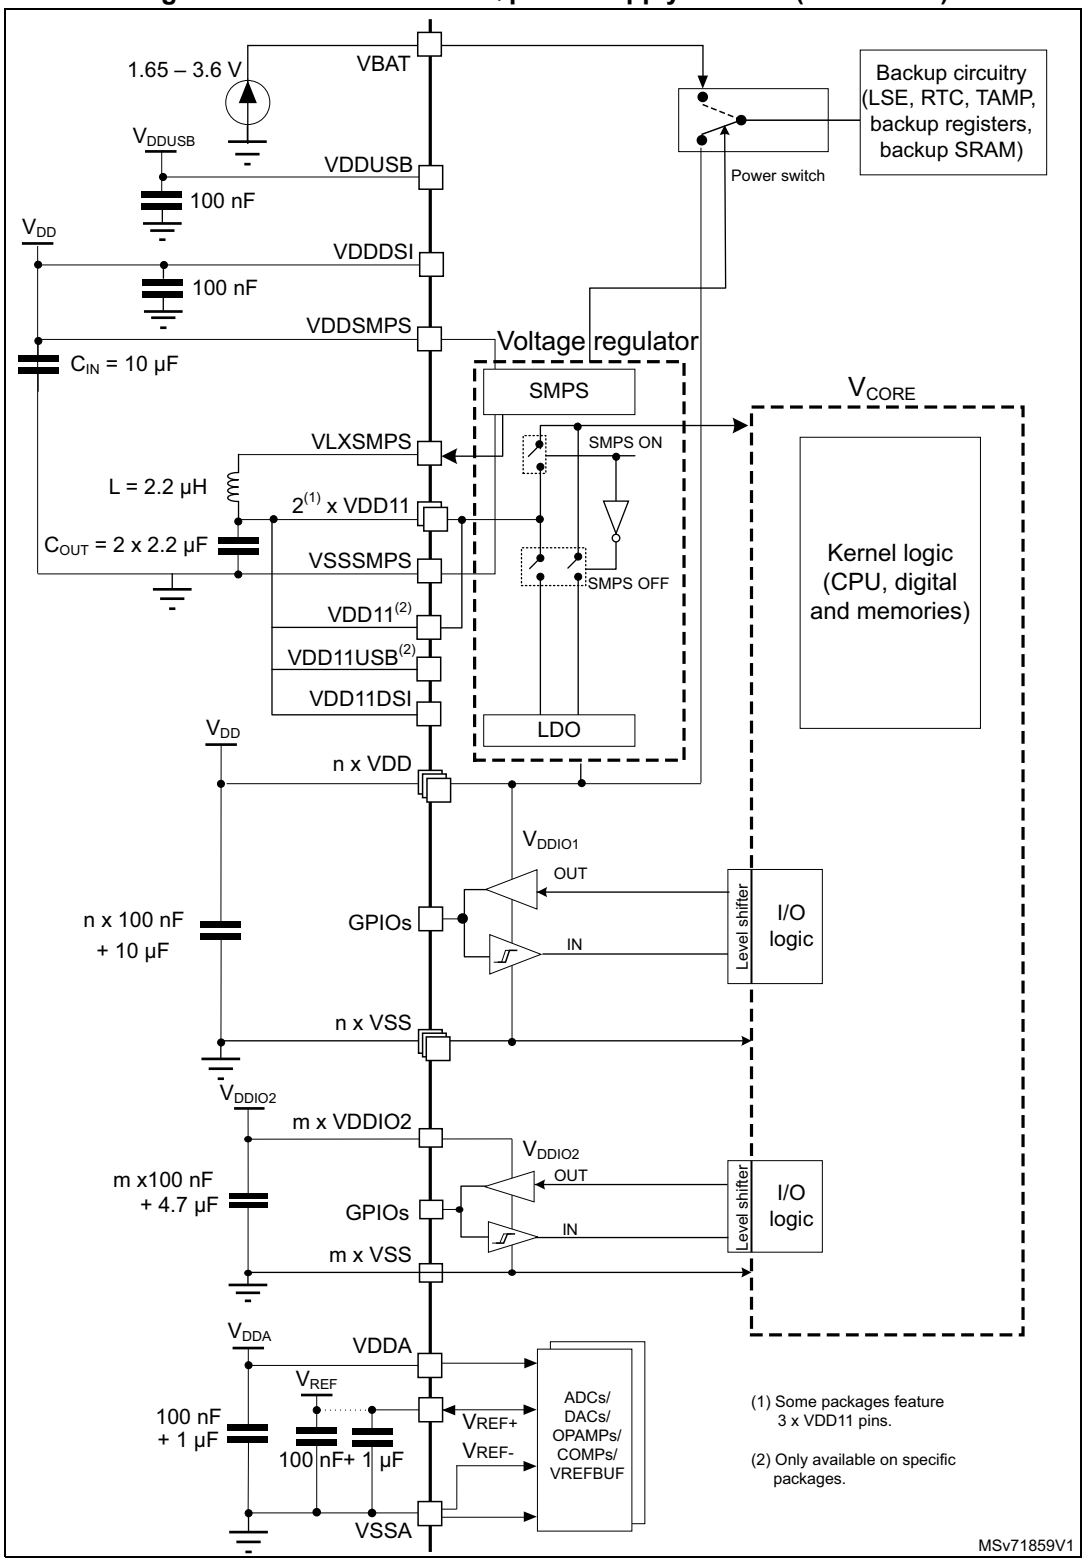
as close as possible to, or below, the appropriate pins on the underside of the PCB to ensure the proper functionality of the device.

Figure 15. STM32U5Fxxx power supply scheme (without SMPS)



Downloaded from Arrow.com.

Figure 16. STM32U5FxxxxxQ power supply scheme (with SMPS)



Downloaded from Arrow.com.

The external capacitor on VCAP pin requires the following characteristics:

- C_{OUT} = 4.7 µF or 2 × 2.2 µF ±20%
- C_{OUT} ESR < 20 mΩ at 3 MHz
- C_{OUT} rated voltage ≥ 10 V

Note: SMPS and LDO regulators provide, in a concurrent way, the V_{CORE} supply depending on application requirements. However, only one of them is active at the same time. When SMPS is active, it feeds the V_{CORE} on the two VDD11 pins supplied by the filtered SMPS VLXSMPS output pin. When LDO is active, it supplies the V_{CORE} and regulates it using the same capacitors on VDD11 pins. It is recommended to add a decoupling capacitor of 100 nF near each VDD11 pin/ball, but it is not mandatory.

The external capacitors on VDD11 pins require the following characteristics:

- C_{OUT} = 2 × 2.2 µF ±20%
- C_{OUT} ESR < 20 mΩ at 3 MHz
- C_{OUT} rated voltage ≥ 10 V

The external capacitor on VDDSMPS pin requires the following characteristics:

- C_{IN} = 10 µF ±20%
- C_{IN} ESR < 10 mΩ at 3 MHz
- C_{IN} rated voltage ≥ 10 V

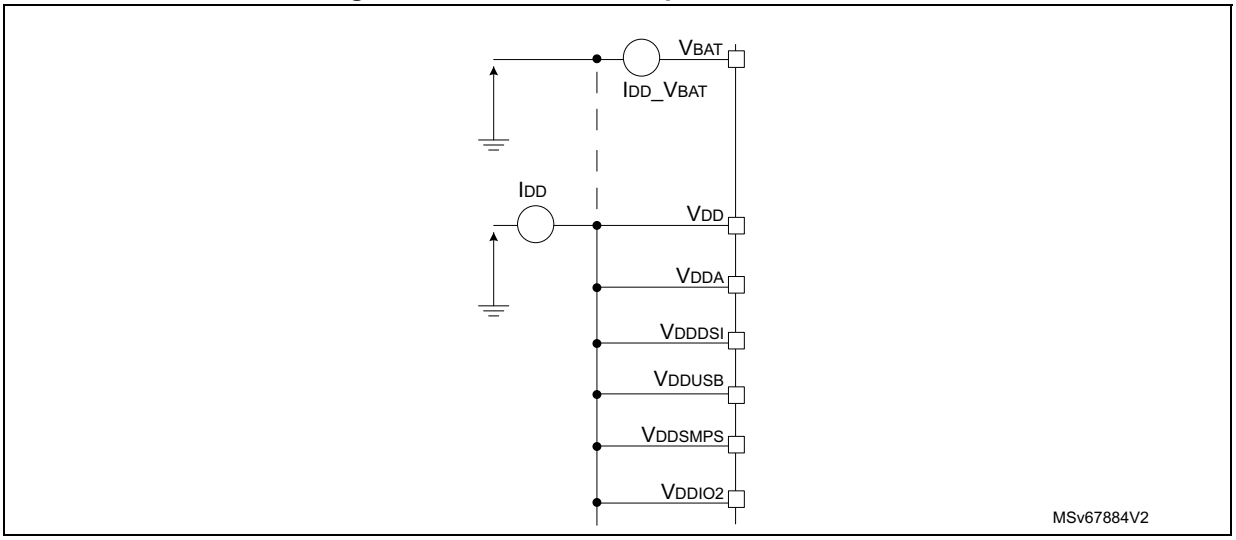
The external inductance between VLXSMPS and VDD11 requires the following characteristics:

- L = 2.2 µH ±20%
- L_{ISAT} > 0.5 A
- L DCR < 200 mΩ

5.1.7 Current consumption measurement

The I_{DD} parameters given in various tables in the next sections, represent the total MCU consumption including the current supplying V_{DD}, V_{DDIO2}, V_{DDA}, V_{DDUSB}, V_{DDDSI}, V_{BAT}, and V_{DDSMPS} (if the device embeds the SMPS).

Figure 17. Current consumption measurement



Downloaded from Arrow.com.

5.2 Absolute maximum ratings

Stresses above the absolute maximum ratings listed in *Table 29*, *Table 30*, and *Table 31* may damage the device. These are stress ratings only and the functional operation of the device at these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability. Device mission profile (application conditions) is compliant with JEDEC JESD47 qualification standard, extended mission profiles are available on demand.

Table 29. Voltage characteristics(1) (2)

Symbol	Ratings	Min	Max	Unit
V_{DDX} - V_{SS}	External main supply voltage (including V_{DDSMPS}, V_{DDA}, V_{DDUSB}, V_{DDDSI}, V_{BAT}, V_{REF+})	-0.3	4.0	V
V_{DDIOx}(3) - V_{SS}	I/O supply when HSLV = 0	-0.3	4.0	
	I/O supply when HSLV = 1	-0.3	2.75	
V_{IN}(4)	Input voltage on FT_xx pins except FT_c pins	V_{SS} - 0.3	Min (min (V_{DD}, V_{DDA}, V_{DDUSB}, V_{DDIO2}) + 4.0, 6.0)(5)(6)	
	Input voltage on FT_t pins in V_{BAT} mode	V_{SS} - 0.3	Min (min (V_{BAT}, V_{DDA}, V_{DDUSB}, V_{DDIO2}) + 4.0, 6.0)(5)(6)	
	Input voltage on FT_c pins	V_{SS} - 0.3	5.5	
	Input voltage on any other pins	V_{SS} - 0.3	4.0	
V_{REF+} - V_{DDA}	Allowed voltage difference for V_{REF+} > V_{DDA}	-	0.4	
$\lvert\Delta V_{DDx}\rvert$	Variations between different VDDx power pins of the same domain	-	50.0	mV
$\lvert V_{SSx}-V_{SS}\rvert$	Variations between all the different ground pins(7)	-	50.0	

1. All main power (VDD, VDDSMPS, VDDA, VDDUSB, VDDIO2, VDDDSI, VBAT) and ground (VSS, VSSA, VSSSMPS) pins must always be connected to the external power supply, in the permitted range.
2. The I/O structure options listed in this table can be a concatenation of options including the option explicitly listed. For instance TT_a refers to any TT I/O with _a option. TT_xx refers to any TT I/O and FT_xx refers to any FT I/O.
3. V_{DDIO1} or V_{DDIO2} or V_{SW}, V_{DDIO1} = V_{DD}.
4. V_{IN} maximum must always be respected. Refer to *Table 30* for the maximum allowed injected current values.
5. To sustain a voltage higher than 4 V, the internal pull-up/pull-down resistors must be disabled.
6. This formula has to be applied only on the power supplies related to the I/O structure described in the pin definition table.
7. Including VREF- pin.

Downloaded from Arrow.com.

Table 30. Current characteristics

Symbol	Ratings	Max	Unit
$\sum IV_{DD}$	Total current into sum of all V_{DD} power lines (source)(1)	200	mA
$\sum IV_{SS}$	Total current out of sum of all V_{SS} ground lines (sink)(1)	200	
IV_{DD}	Maximum current into each VDD power pin (source)(1)	100	
IV_{SS}	Maximum current out of each VSS ground pin (sink)(1)	100	
I_{IO}	Output current sunk by any I/O and control pin	20	
	Output current sourced by any I/O and control pin	20	
$\sum I_{(PIN)}$	Total output current sunk by sum of all I/Os and control pins(2)	120	
	Total output current sourced by sum of all I/Os and control pins(2)	120	
$I_{INJ(PIN)}$(3)(4)	Injected current on FT_xx, TT_xx, RST pins	-5/+0	
$\sum\lvert I_{INJ(PIN)}\rvert$	Total injected current (sum of all I/Os and control pins)(5)	±25	

1. All main power (VDD, VDDSMPS, VDDA, VDDUSB, VDDDSI, VDDIO2, VBAT) and ground (VSS, VSSA, VSSSMPS) pins must always be connected to the external power supplies, in the permitted range.
2. This current consumption must be correctly distributed over all I/Os and control pins. The total output current must not be sunk/sourced between two consecutive power supply pins, referring to high pin count QFP packages.
3. Positive injection (when $V_{IN} > V_{DDIOx}$) is not possible on these I/Os and does not occur for input voltages lower than the specified maximum value.
4. A negative injection is induced by $V_{IN} < V_{SS}$. $I_{INJ(PIN)}$ must never be exceeded. Refer also to *Table 29* for the minimum allowed input voltage values.
5. When several inputs are submitted to a current injection, the maximum $\sum\lvert I_{INJ(PIN)}\rvert$ is the absolute sum of the negative injected currents (instantaneous values).

Table 31. Thermal characteristics

Symbol	Ratings	Value	Unit
T_{STG}	Storage temperature range	–65 to +150	°C
T_J	Maximum junction temperature	140

5.3 Operating conditions

5.3.1 General operating conditions

Table 32. General operating conditions

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{DD}	Standard operating voltage	HSLV(1) = 0	1.71(2)	-	3.6	V
		HSLV = 1	1.71(2)	-	2.7	
V_{DDSMPS}	Supply voltage for the internal SMPS step-down converter	-	V_{DD}			
V_{DDIO2}	Supply voltage for PG[15:2] I/Os	At least one I/O in PG[15:2] used, HSLV = 0	1.08	-	3.6	
		At least one I/O in PG[15:2] used, HSLV = 1	1.08	-	2.7	
		PG[15:2] I/Os not used	0	-	3.6	
V_{DDUSB}	USB supply voltage	USB used	3.0	-	3.6	
		USB not used	0	-	3.6	
V_{DDA}	Analog supply voltage	COMP used	1.58	-	3.6	V
		DAC or OPAMP used	1.60	-	3.6	
		ADC used	1.62	-	3.6	
		VREFBUF used (normal mode)	1.8	-	3.6	
		ADC, DAC, COMP, OPAMP, and VREFBUF not used	0	-	3.6	
V_{BAT}	Backup domain supply voltage	-	1.65(3)	-	3.6	
V_{IN}	I/O input voltage	All I/Os except FT_c and TT_xx pins	-0.3	-	Min (min(V_{DD}, V_{DDA}, V_{DDUSB}, V_{DDIO2}) +3.6, 5.5)(4)(5)	
		Input voltage on FT_t pins in V_{BAT} mode	-0.3	-	Min (min(V_{BAT}, V_{DDA}, V_{DDUSB}, V_{DDIO2}) + 3.6, 5.5)(4)(5)	
		FT_c I/Os	-0.3	-	5.0	
		TT_xx I/Os	-0.3	-	V_{DDIOx} + 0.3	
I_{IO_SW}	Sum of output current sourced by all I/Os powered by V_{SW}(6)	-	-	-	3	mA

Downloaded from Arrow.com.

Table 32. General operating conditions (continued)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{CORE}	Internal regulator ON	Range 1	1.15	1.21	1.27	V
		Range 2	1.05	1.1	1.15	
		Range 3	0.95	1.0	1.05	
		Range 4	0.81	0.9	0.99	
f_{HCLK}	AHB clock frequency	Range 1	-	-	160	MHz
		Range 2	-	-	110	
		Range 3	-	-	55	
		Range 4	-	-	25	
f_{PCLKx} (x = 1, 2, 3)	APB1, APB2, APB3 clock frequency	Range 1	-	-	160	
		Range 2	-	-	110	
		Range 3	-	-	55	
		Range 4	-	-	25	
P_D	Power dissipation at T_A = 85 °C for suffix 6[7]	LQFP100	See *Section 6.7: Package thermal characteristics* for application appropriate thermal resistance and package. The power dissipation is then calculated according to ambient temperature (T_A) and maximum junction temperature (T_J) and selected thermal resistance.			mW
		LQFP144				
		UFBGA144				
		WLCSP208				
		TFBGA216				
P_D	Power dissipation at T_A = 125 °C for suffix 3[7]	LQFP100				
		LQFP144				
		UFBGA144				
		WLCSP208				
		TFBGA216				
T_A	Ambient temperature for suffix 6	Maximum power dissipation	–40	-	85	°C
		Low-power dissipation[8]	–40	-	105	
	Ambient temperature for suffix 3	Maximum power dissipation	–40	-	125	
		Low-power dissipation[8]	–40	-	130	
T_J	Junction temperature range	Suffix 6 version	–40	-	105	
		Suffix 3 version	–40	-	130	

1. HSLV means high-speed low-voltage mode (refer to the GPIO section of the product reference manual).
2. When RESET is released, the functionality is guaranteed down to V_{BORx} min.
3. In V_{BAT} mode, the functionality is guaranteed down to V_{BOR_VBAT} min.
4. This formula has to be applied only on the power supplies related to the I/O structure described by the pin definition table. The maximum I/O input voltage is the smallest value between Min (V_{DD}, V_{DDA}, V_{DDUSB}, V_{DDIO2})+3.6 V, and 5.5V.
5. For operation with voltage higher than Min (V_{DD}, V_{DDA}, V_{DDUSB}, V_{DDIO2}) +0.3 V, the internal pull-up and pull-down resistors must be disabled.

Downloaded from Arrow.com.

6. The I/Os powered by V_{SW} are:
   - PC13, PC14, PC15 when VDD is present.
   - PC13, PC14, PC15, and all FT_t I/Os in V_{BAT} mode.
7. If T_A is lower, higher P_D values are allowed as long as T_J does not exceed T_J max (see *Section 6.7: Package thermal characteristics*).
8. In low-power dissipation state, T_A can be extended to this range as long as T_J does not exceed T_J max (see *Section 6.7: Package thermal characteristics*).

5.3.2 Operating conditions at power-up/power-down

The parameters given in the table below are derived from tests performed under the ambient temperature condition summarized in *Table 32*.

Table 33. Operating conditions at power-up/power-down

Symbol	Parameter	Conditions	Min	Max	Unit
t_{VDD}	V_{DD} rise-time rate	-	0	∞	µs/V
	V_{DD} fall-time rate	ULPMEN = 0 (default value)	20	∞	
		Standby mode, BOR level 0 selected with ULPMEN = 1	250	∞	ms/V

5.3.3 Embedded reset and power control block characteristics

The parameters given in the table below are derived from tests performed under the ambient temperature conditions summarized in *Table 32*.

Table 34. Embedded reset and power control block characteristics(1)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$t_{RSTTEMPO}$(2)	Reset temporization after BOR0 is detected	V_{DD} rising	-	-	900	µs
V_{BOR0}	Brownout reset threshold 0	Rising edge	1.6	1.66	1.71	V
		Falling edge, range 1, 2, 3	1.58	1.64	1.69	
		Falling edge, range 4 and low-power modes	1.58	1.64	1.69	
V_{BOR1}	Brownout reset threshold 1	Rising edge	1.98	2.08	2.17	
		Falling edge	1.9	2.00	2.1	
V_{BOR2}	Brownout reset threshold 2	Rising edge	2.18	2.29	2.39	
		Falling edge	2.08	2.18	2.25	

Downloaded from Arrow.com.

Table 34. Embedded reset and power control block characteristics(1) (continued)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{BOR3}	Brownout reset threshold 3	Rising edge	2.48	2.59	2.7	V
		Falling edge	2.39	2.5	2.61	
V_{BOR4}	Brownout reset threshold 4	Rising edge	2.76	2.88	3.0	
		Falling edge	2.67	2.79	2.9	
V_{PVD0}	Programmable voltage detector threshold 0	Rising edge	2.03	2.13	2.23	
		Falling edge	1.93	2.03	2.12	
V_{PVD1}	PVD threshold 1	Rising edge	2.18	2.29	2.39	
		Falling edge	2.08	2.18	2.28	
V_{PVD2}	PVD threshold 2	Rising edge	2.33	2.44	2.55	
		Falling edge	2.23	2.34	2.44	
V_{PVD3}	PVD threshold 3	Rising edge	2.47	2.59	2.7	
		Falling edge	2.39	2.50	2.61	
V_{PVD4}	PVD threshold 4	Rising edge	2.6	2.72	2.83	
		Falling edge	2.5	2.62	2.73	
V_{PVD5}	PVD threshold 5	Rising edge	2.76	2.88	3.0	
		Falling edge	2.66	2.78	2.9	
V_{PVD6}	PVD threshold 6	Rising edge	2.83	2.96	3.08	
		Falling edge	2.76	2.88	3.0	
V_{hyst_BOR0}	Hysteresis voltage of BOR0	-	-	20	-	mV
$V_{hyst_BOR_PVD}$	Hysteresis voltage of BOR (except BOR0) and PVD	-	-	80	-	
$t_{BOR0_sampling}$	BOR0 sampling period	ULPMEN = 1	-	30	55	ms
I_{DD_BOR0}(2)	Additional BOR0 consumption if ULPMEN = 0 versus ULPMEN = 1	Standby mode	-	60	-	nA
$I_{DD_BOR_PVD}$(2)	BOR(3) (except BOR0) and PVD consumption from V_{DD}(4)	-	-	1	1.5	µA
V_{BOR_VBAT}	V_{BAT} brownout reset threshold	-	1.58	-	1.65	V
$t_{VBAT_BOR_sampling}$	V_{BAT} BOR sampling period in V_{BAT} mode	MONEN = 0(5)	-	0.5	2.5	s
V_{AVM1}	V_{DDA} voltage monitor 1 threshold	Rising edge	1.61	1.68	1.75	V
		Falling edge	1.58	1.65	1.71	
V_{AVM2}	V_{DDA} voltage monitor 2 threshold	Rising edge	1.77	1.86	1.95	
		Falling edge	1.73	1.82	1.9	
V_{IO2VM}	V_{DDIO2} voltage monitor threshold	-	0.96	1.01	1.05	
V_{UVM}	V_{DDUSB} voltage monitor threshold	-	1.15	1.22	1.28	
V_{hyst_AVM}	Hysteresis of V_{DDA} voltage monitor	-	-	40	-	mV

Downloaded from Arrow.com.

Table 34. Embedded reset and power control block characteristics(1) (continued)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
I_{DD_VM}(2)	Voltage monitor consumption from V_{DD} (AVM1, AVM2, IO2VM or UVM single instance)	-	-	0.4	0.6	µA
$I_{DD_AVM_A}$(2)	V_{DDA} voltage monitor consumption from V_{DDA} (resistor bridge)	-	-	1.25	1.85	

1. Evaluated by characterization and not tested in production, unless otherwise specified.
2. Specified by design. Not tested in production
3. BOR0 is enabled in all modes (except Shutdown), and its consumption is therefore included in the supply current characteristics tables.
4. This is also the consumption saved in Standby mode when ULPMEN = 1.
5. V_{BAT} brownout reset monitoring is discontinuous when MONEN = 0 in PWR_BDCR1, and is continuous when MONEN = 1.

5.3.4 SMPS characteristics

Table 35. SMPS characteristics

Symbol	Parameter	Conditions	Typ	Unit
Freq	Switching frequency (range 1, 2, 3)(1)	V_{DD} > 1.9 V	3	MHz
		V_{DD} < 1.9 V	1.5	

1. The SMPS is asynchronous in range 4 and low-power modes.

5.3.5 Embedded voltage reference

The parameters given in the table below are derived from tests performed under the ambient temperature and supply voltage conditions summarized in *Table 32*.

Table 36. Embedded internal voltage reference

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{REFINT}(1)	Internal reference voltage	Range 1, 2, 3	1.175	1.215	1.255	V
		Range 4 and low-power modes	1.170	1.215	1.260	
$t_{S_vrefint}$(2)(3)	ADC sampling time when reading the internal reference voltage	-	12.65	-	-	µs
$t_{start_vrefint}$(3)	Start time of reference voltage buffer when the ADC is enabled	-	-	4	6	
$I_{DD(VREFINTBUF)}$(3)	V_{REFINT} buffer consumption from V_{DD} when converted by the ADC	-	-	1.5	2.1	µA
ΔV_{REFINT}(4)	Internal reference voltage spread over the temperature range	V_{DD} = 3 V	-	6	11.5	mV
T_{Coeff}(4)	Average temperature coefficient	–40°C < T_J < +130 °C	-	40	125	ppm/°C
A_{Coeff}(3)	Long term stability	1000 hours, T_J = 25 °C	-	400	1000	ppm
$V_{DDCoeff}$(4)	Average voltage coefficient	3.0 V ≤ V_{DD} ≤ 3.6 V	-	500	2900	ppm/V

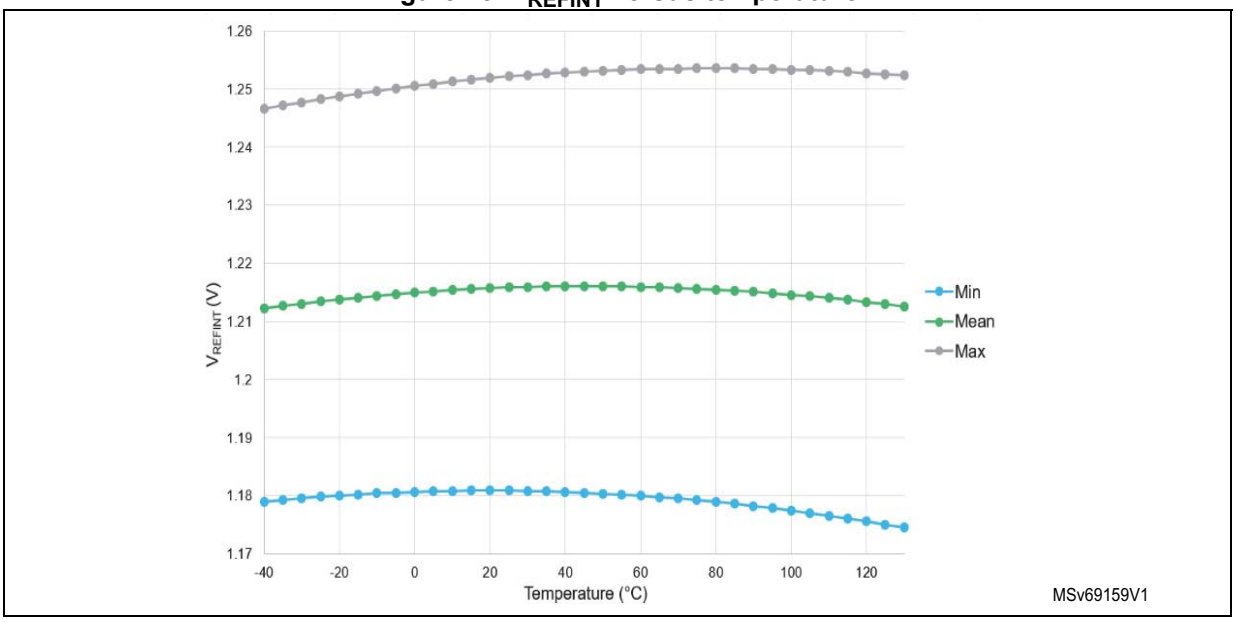
Downloaded from Arrow.com.

Table 36. Embedded internal voltage reference (continued)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{REFINT_DIV1}(3)	1/4 reference voltage	-	24	25	26	% V_{REFINT}
V_{REFINT_DIV2}(3)	1/2 reference voltage		49	50	51	
V_{REFINT_DIV3}(3)	3/4 reference voltage		74	75	76	

1. V_{REFINT} does not take into account package and soldering effects.
2. The shortest sampling time for the application can be determined by multiple iterations.
3. Specified by design. Not tested in production
4. Evaluated by characterization. Not tested in production.

Figure 18. V_{REFINT} versus temperature



Downloaded from Arrow.com.

5.3.6 Supply current characteristics

The current consumption is a function of several parameters and factors such as the operating voltage, ambient temperature, I/O pin loading, device software configuration, operating frequencies, I/O pin switching rate, program location in memory and executed binary code.

The current consumption is measured as described in *Section 5.1.7: Current consumption measurement*.

Typical and maximum current consumption

The MCU is placed under the following conditions:

- All I/O pins are in analog input mode.
- All peripherals are disabled except when explicitly mentioned.
- The flash memory access time is adjusted with the minimum wait-state number, depending on the f_{HCLK} frequency (refer to the tables “Number of wait states according to CPU clock (HCLK) frequency” available in the product reference manual).
- When the peripherals are enabled, $f_{PCLK} = f_{HCLK}$.
- The voltage scaling range is adjusted to f_{HCLK} frequency as follows:
  - Voltage range 1 for 110 MHz < f_{HCLK} ≤ 160 MHz
  - Voltage range 2 for 55 MHz < f_{HCLK} ≤ 110 MHz
  - Voltage range 3 for 25 MHz < f_{HCLK} ≤ 55 MHz
  - Voltage range 4 for f_{HCLK} ≤ 25 MHz

The parameters given in the tables below are derived from tests performed under ambient temperature and supply voltage conditions summarized in *Table 32*. These parameters are evaluated by characterization, and not tested in production unless otherwise specified.

Downloaded from Arrow.com.

Table 37. Current consumption in Run mode on LDO, code with data processing running from flash memory, ICACHE ON in 1-way, prefetch ON(1)

Symbol	Parameter	Conditions			Typ					Max at 1.71 V ≤ V_{DD} ≤ 3.6 V(2)					Unit
		-	Voltage scaling	f_{HCLK} (MHz)	25°C	55°C	85°C	105°C	125°C	30°C	55°C	85°C	105°C	125°C	
I_{DD} (Run)	Supply current in Run mode	$f_{HCLK} = f_{MSI}$, all peripherals disabled, Flash bank 2 in power down, all SRAMs enabled	Range 4	24	2.0	2.85	5.30	9.0	15.5	3.5	5.7	14	24	44	mA
				16	1.55	2.40	4.90	8.5	15.0	3.0	5.2	13	24	44

Table 40. Static power consumption of flash memory banks when supplied by LDO or SMPS

Symbol	Parameter	Typ					Max					Unit
		25	55	85	105°C	125°C	30°C	55°C	85°C	105°C	125°C	
$I_{DD(Flash_Bank1)}$ (1)	Flash bank 1 static consumption in normal mode (PD1 = 1 versus PD1 = 0)	49	53	65	84	120	66	77	98	123	175	µA
$I_{DD(Flash_Bank2)}$ (1)	Flash bank 2 static consumption in normal mode (PD2 = 1 versus PD2 = 0)	47	52	65	84	120	64	76	98	123	175	
$I_{DD(Flash_Bank_LPM)}$ (2)	One Flash bank additional static consumption in normal mode versus low-power mode (LPM = 0 versus. LPM = 1)	25	26	27	27	28	34	38	43	45	48	

1. When the flash memory is in power-down in Sleep mode (SLEEP_PD = 1), Bank 1 and Bank 2 are in power-down.
2. If no bank is in power-down, the additional static consumption of the Flash memory in normal mode versus low-power mode is 2 × $I_{DD(Flash_Bank_LPM)}$.

I/O system current consumption

The current consumption of the I/O system has two components: static and dynamic.

I/O static current consumption

All the I/Os used as inputs with pull-up or pull-down generate current consumption when the pin is externally held to the opposite level. The value of this current consumption can be simply computed by using the pull-up/pull-down resistors values given in *Section 5.3.15: I/O port characteristics*.

For the output pins, any internal or external pull-up or pull-down or external load must also be considered to estimate the current consumption.

Additional I/O current consumption is due to I/Os configured as inputs if an intermediate voltage level is externally applied. This current consumption is caused by the input Schmitt trigger circuits used to discriminate the input value. Unless this specific configuration is required by the application, this supply current consumption can be avoided by configuring these I/Os in analog mode. This is notably the case of the ADC input pins, that must be configured as analog inputs.

Caution: Any floating input pin can also settle to an intermediate voltage level or switch inadvertently, as a result of external electromagnetic noise. To avoid current consumption related to floating pins, they must either be configured in analog mode, or forced internally to a definite digital value. This can be done either by using pull-up/down resistors or by configuring the pins in output mode.

I/O dynamic current consumption

In addition to the on-chip peripheral current consumption (see *Table 72*), the I/Os used by an application also contribute to the current consumption. When an I/O pin switches, it uses the current from the I/O supply voltage to supply the I/O pin circuitry and to charge/discharge the capacitive load (internal and external) connected to the pin:

$$I_{SW} = V_{DDIOx} \times f_{SW} \times C$$

where:

- I_{SW} is the current sunk by a switching I/O to charge/discharge the capacitive load.
- V_{DDIOx} is the I/O supply voltage.
- f_{SW} is the I/O switching frequency.
- C is the total capacitance seen by the I/O pin: $C = C_{INT} + C_{EXT} + C_S$.
- C_S is the PCB board capacitance including the pad pin.

The test pin is configured in push-pull output mode and is toggled by software at a fixed frequency.

On-chip peripheral current consumption

The current consumption of the on-chip peripherals is given in the table below. The MCU is placed under the following conditions:

- All I/O pins are in analog mode.
- The given value is calculated by measuring the difference of the current consumptions:
  - when the peripheral is clocked on
  - when the peripheral is clocked off

Downloaded from Arrow.com.

- The ambient operating temperature and supply voltage conditions are summarized in *Table 32: General operating conditions*.
- The power consumption of the digital part of the on-chip peripherals is given in the table below. The power consumption of the analog part of the peripherals (where applicable) is indicated in each related section of the datasheet.

5.3.7 Wake-up time from low-power modes and voltage scaling transition times

The wake-up times given in the table below are the latency between the event and the execution of the first user instruction (FSTEN = 1 in PWR_CR3 if not mentioned).

The device goes in low-power mode after the WFE (wait for event) instruction.

Downloaded from Arrow.com.

Table 73. Low-power mode wake-up timings on LDO(1)

Mode	Parameter	Conditions		Typ (3V, 25°C)	Max (3V)	Unit

1. Evaluated by characterization. Not tested in production.
2. Time to REGS change in PWR_SVMSR.
3. Time to VOSRDY = 1 in PWR_VOSR.

Table 76. Wake-up time using USART/LPUART(1)

Symbol	Parameter	Typ	Max	Unit
$t_{WUUSART}$ $t_{WULPUART}$	Wake-up time needed to calculate the maximum USART/LPUART baudrate that is needed to wake up from Stop mode when the USART/LPUART kernel clock source is HSI16/MSI.	-	(2)	µs

1. Specified by design. Not tested in production.
2. This wake-up time is the HSI16 (see *Table 81*) or the MSI (see *Table 82*) oscillator maximum startup time.

5.3.8 External clock timing characteristics

High-speed external user clock generated from an external source

In bypass mode, the HSE oscillator is switched off and the input pin is a standard GPIO.

The external clock signal has to respect the I/O characteristics in *Section 5.3.15: I/O port characteristics*. The recommended clock input waveform is shown in *Figure 19*.

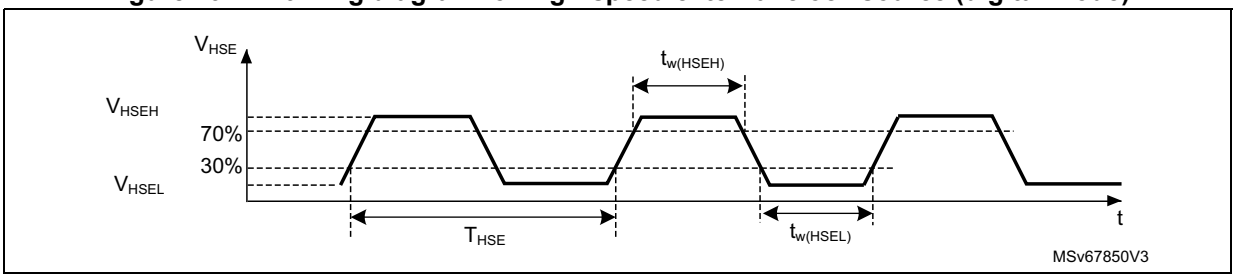
Downloaded from Arrow.com.

Table 77. High-speed external user clock characteristics(1)

Symbol	Parameter	Conditions		Min	Typ	Max	Unit
f_{HSE_ext}	User external clock source frequency	Digital mode (HSEBYP = 1, HSEEXT = 1)	Voltage scaling range 1, 2, 3	-	-	55	MHz
		Analog mode (HSEBYP = 1, HSEEXT = 0)		4	-	50	
		-	Voltage scaling range 4	4(2)	-	25	
V_{HSEH}	OSC_IN input pin high-level voltage	Digital mode (HSEBYP = 1, HSEEXT = 1)	-	$0.7 \times V_{DD}$	-	V_{DD}	V
V_{HSEL}	OSC_IN input pin low-level voltage		-	V_{SS}	-	$0.3 \times V_{DD}$	
$t_{w(HSEH)}t_{w(HSEL)}$	OSC_IN high or low time		Voltage scaling range 1, 2, 3	7	-	-	ns
			Voltage scaling range 4	18	-	-	

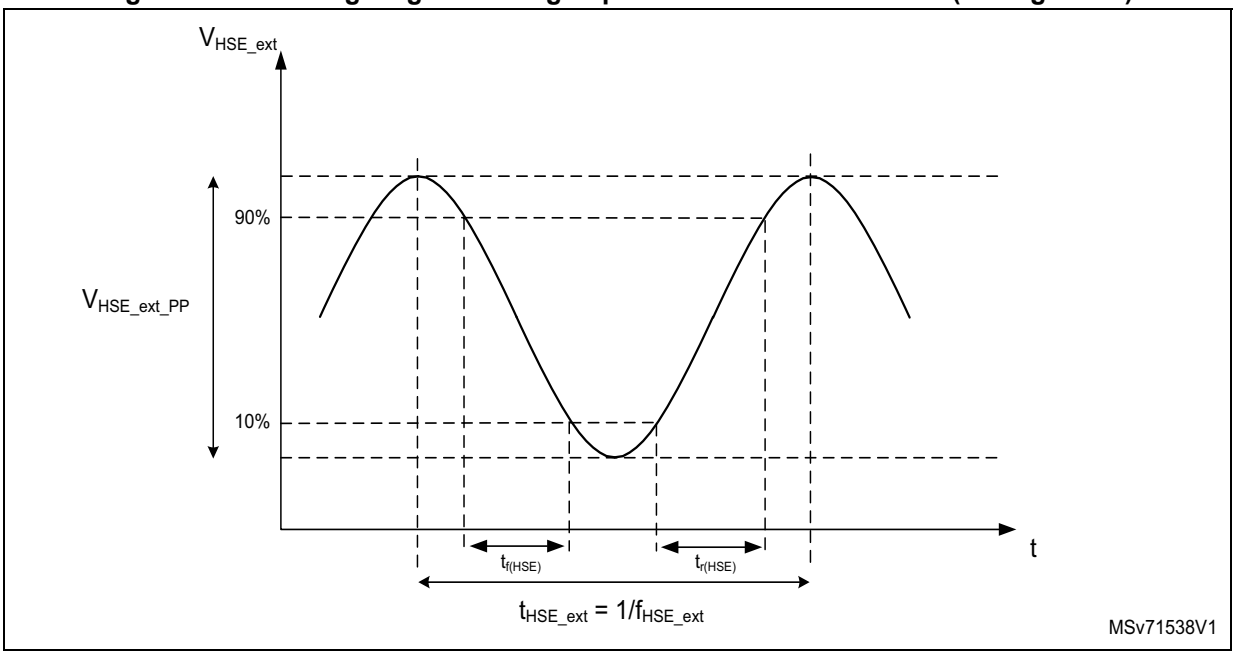
1. Specified by design. Not tested in production.
2. Only for analog mode. No minimum value in digital mode.

Figure 19. AC timing diagram for high-speed external clock source (digital mode)



Downloaded from Arrow.com.

Figure 20. AC timing diagram for high-speed external clock source (analog mode)



Low-speed external user clock generated from an external source

In bypass mode, the LSE oscillator is switched off and the input pin is a standard GPIO.

The external clock signal has to respect the I/O characteristics in *Section 5.3.15: I/O port characteristics*. The recommended clock input waveform is shown in *Figure 21* and *Figure 22*.

Table 78. Low-speed external user clock characteristics(1)

Symbol	Parameter	Min	Typ	Max	Unit
f_{LSE_ext}	User external clock source frequency	5	32.768	40	kHz
$V_{LSE_ext_PP}$	OSC32_IN peak-to-peak amplitude	0.3	-	V_{SW}	V
V_{LSE_ext}	OSC32_IN input range	0	-	V_{SW}(2)	
$t_{w(LSEH)}$ $t_{w(LSEL)}$	OSC32_IN high or low time for square signal input	10	-	-	ns

1. Specified by design. Not tested in production.
2. In case VBAT mode is used, V_{LSE_ext} must be lower than V_{BOR0} in order to respect this requirement when the switch to VBAT occurs.

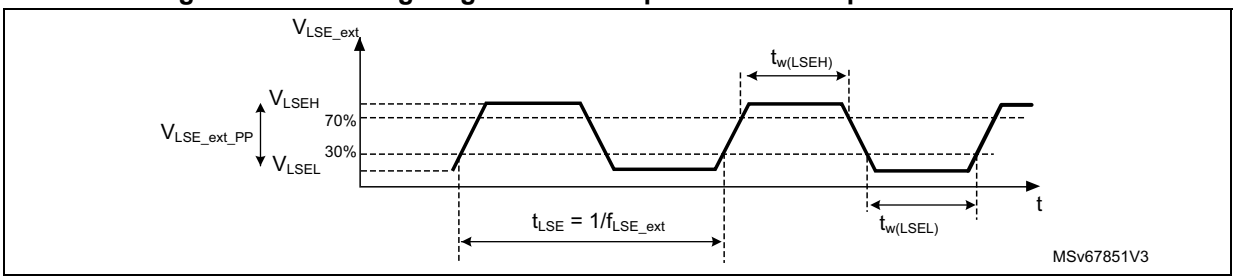

Figure 22. AC timing diagram for low-speed external sinusoidal clock source

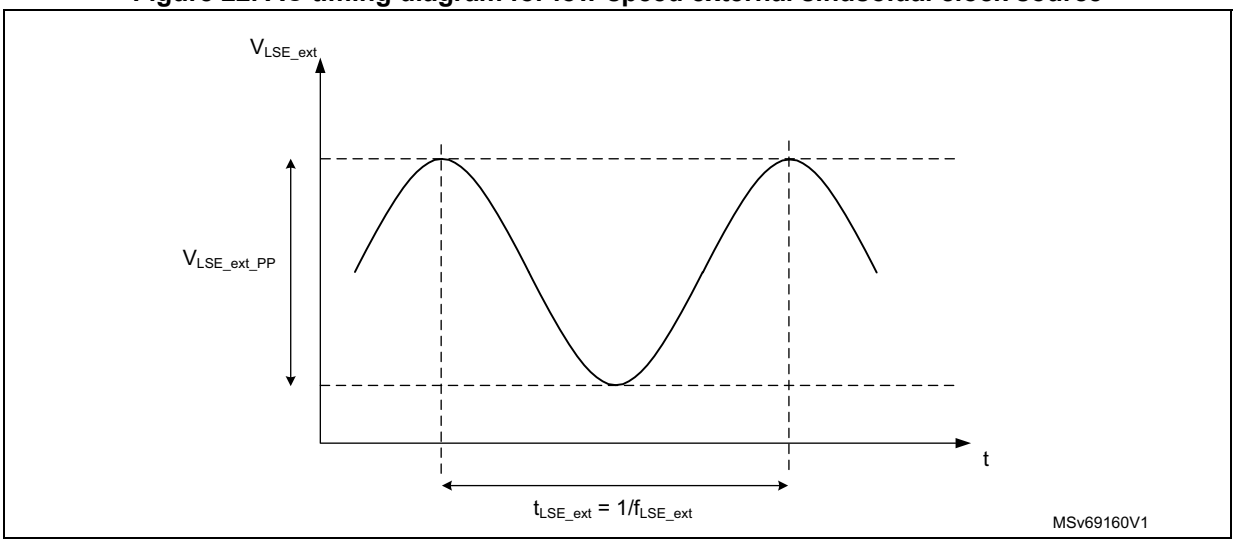


High-speed external clock generated from a crystal/ceramic resonator

The high-speed external (HSE) clock can be supplied with a 4 to 48 MHz crystal/ceramic resonator oscillator. All information given in this paragraph are based on design simulation results obtained with typical external components specified in the table below.

In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins, in order to minimize the output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details on the resonator characteristics (frequency, package, accuracy).

Table 79. HSE oscillator characteristics(1)

Symbol	Parameter	Conditions(2)	Min	Typ	Max	Unit
f_{OSC_IN}	Oscillator frequency	-	4	-	50	MHz
R_F	Feedback resistor	-	-	200	-	kΩ

Downloaded from Arrow.com.

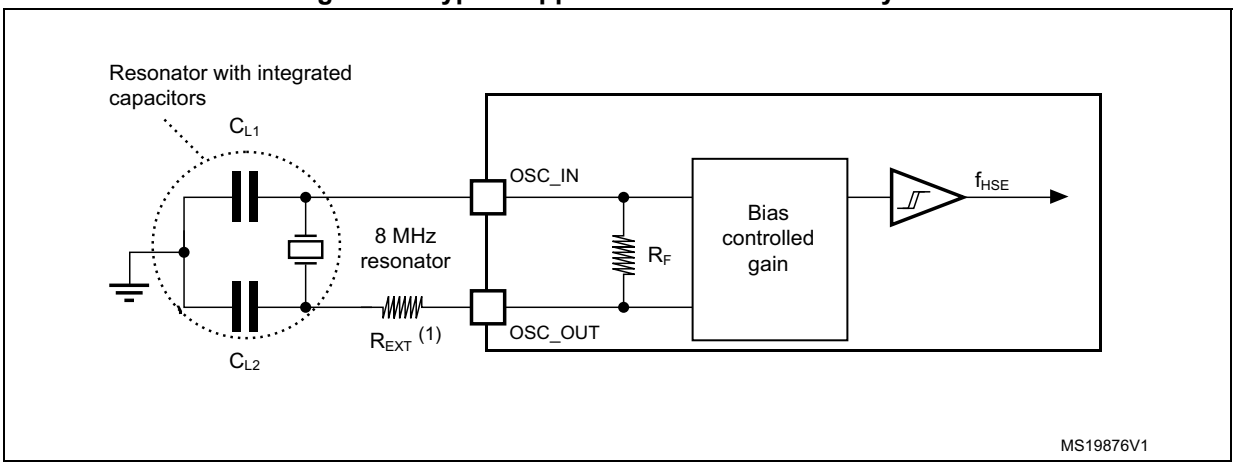
Table 79. HSE oscillator characteristics(1) (continued)

Symbol	Parameter	Conditions(2)	Min	Typ	Max	Unit
$I_{DD(HSE)}$	HSE current consumption	During startup(3)	-	-	8	mA
		V_{DD} = 3 V, Rm = 30 Ω, CL = 10 pF @ 4 MHz	-	790	-	µA
		V_{DD} = 3 V, Rm = 30 Ω, CL = 10 pF @ 8 MHz	-	910	-	
		V_{DD} = 3 V, Rm = 45 Ω, CL = 10 pF @ 8 MHz	-	930	-	
		V_{DD} = 3 V, Rm = 30 Ω, CL = 5 pF @ 48 MHz	-	1430	-	
		V_{DD} = 3 V, Rm = 30 Ω, CL = 10 pF @ 48 MHz	-	1960	-	
		V_{DD} = 3 V, Rm = 30 Ω, CL = 20 pF @ 48 MHz	-	3000	-	
$Gm_{critmax}$	Maximum critical crystal transconductance G_m	Startup	-	-	1.5	mA/V
$t_{su(HSE)}$ (4)	Startup time	V_{DD} stabilized	-	2	-	ms

1. Specified by design. Not tested in production.
2. Resonator characteristics given by the crystal/ceramic resonator manufacturer.
3. This consumption level occurs during the first 2/3 of the $t_{SU(HSE)}$ startup time.
4. $t_{SU(HSE)}$ is the startup time measured from the moment it is enabled (by software) to a stabilized 8 MHz oscillation is reached. This value is measured for a standard crystal resonator and it can vary significantly with the crystal manufacturer.

Note: For information on selecting the crystal, refer to the application note 'Oscillator design guide for STM8AF/AL/S, STM32 MCUs and MPUs' (AN2867).

Figure 23. Typical application with an 8 MHz crystal



1. R_{EXT} value depends on the crystal characteristics.

Low-speed external clock generated from a crystal resonator

The low-speed external (LSE) clock can be supplied with a 32.768 kHz crystal resonator oscillator. All information given in this paragraph are based on design simulation results obtained with typical external components specified in the table below. In the application, the resonator and the load capacitors have to be placed as close as possible to the

Downloaded from Arrow.com.

oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details on the resonator characteristics (frequency, package, accuracy).

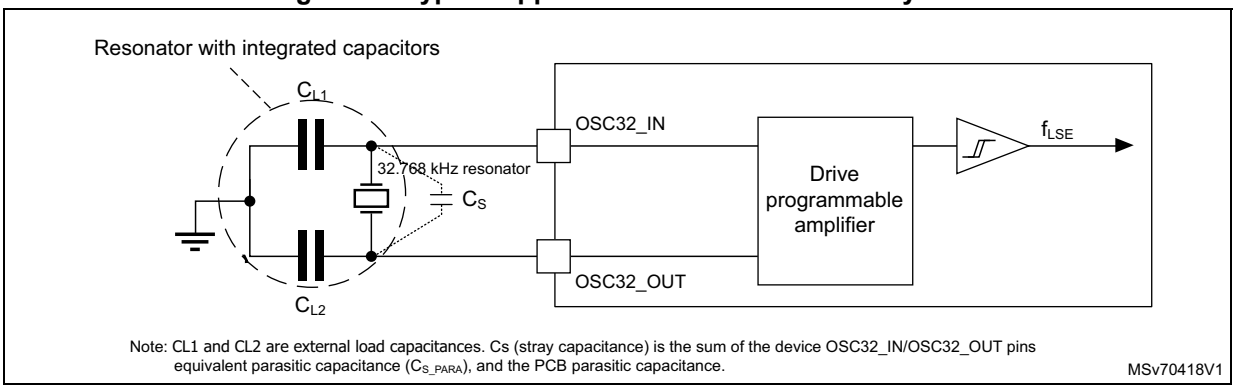
Table 80. LSE oscillator characteristics (f_{LSE} = 32.768 kHz)(1)

Symbol	Parameter	Conditions(2)	Min	Typ	Max	Unit
$I_{DD(LSE)}$	LSE current consumption	LSEDRV[1:0] = 01, medium low-drive capability	-	350	-	nA
		LSEDRV[1:0] = 10, medium high-drive capability	-	450	-	
		LSEDRV[1:0] = 11, high-drive capability	-	600	-	
$Gm_{critmax}$	Maximum critical crystal Gm	LSEDRV[1:0] = 01, medium low-drive capability	-	-	0.75	µA/V
		LSEDRV[1:0] = 10, medium high-drive capability	-	-	1.7	
		LSEDRV[1:0] = 11, high-drive capability	-	-	2.7	
C_{S_PARA}	Internal stray parasitic capacitance(3)	-	-	3	-	pF
$t_{SU(LSE)}$(4)	Startup time	V_{DD} is stabilized	-	2	-	s

1. Specified by design. Not tested in production.
2. Refer to the note below this table.
3. C_{S_PARA} is the equivalent capacitance seen by the crystal due to OSC32_IN and OSC32_OUT internal parasitic capacitances.
4. $t_{SU(LSE)}$ is the startup time measured from the moment it is enabled (by software) to a stabilized 32.768 kHz oscillation is reached. This value is measured for a standard crystal and it can vary significantly with the crystal manufacturer

Note: For information on selecting the crystal, refer to the application note 'Oscillator design guide for STM8AF/AL/S, STM32 MCUs and MPUs' (AN2867).

Figure 24. Typical application with a 32.768 kHz crystal



Note: CL1 and CL2 are external load capacitances. Cs (stray capacitance) is the sum of the device OSC32_IN/OSC32_OUT pins equivalent parasitic capacitance (C_{S_PARA}), and the PCB parasitic capacitance.

Note: An external resistor is not required between OSC32_IN and OSC32_OUT and it is forbidden to add one.

5.3.9 Internal clock timing characteristics

The parameters given in the table below are derived from tests performed under ambient temperature and supply voltage conditions summarized in *Table 32*. The provided curves are characterization results, not tested in production.

Downloaded from Arrow.com.

High-speed internal (HSI16) RC oscillator

Table 81. HSI16 oscillator characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_{HSI16}	HSI16 frequency after factory calibration	V_{DD} = 3.0 V, T_J = 30 °C	15.92	16	16.08	MHz
f_{HSI16}(1)		T_J = –10 °C to 100 °C, 1.58 ≤ V_{DD} ≤ 3.6 V	15.84	-	16.16	
		T_J = –40 °C to 130 °C, 1.58 ≤ V_{DD} ≤ 3.6 V	15.65	-	16.25	
TRIM(2)	HSI16 user trimming step	-	18	29	40	kHz
$DuCy_{HSI16}$(2)	Duty cycle	-	45	-	55	%
$t_{su(HSI16)}$(2)	HSI16 oscillator startup time	-	-	2.5	3.6	µs
$t_{stab(HSI16)}$(2)	HSI16 oscillator stabilization time	At 1% of target frequency	-	4	6	
$I_{DD(HSI16)}$(2)	HSI16 oscillator power consumption	-	-	150	210	µA

1. Evaluated by characterization. Not tested in production. It does not take into account package and soldering effects.
2. Specified by design. Not tested in production.

				Range 4 to 15	-	1 + 1 µA/MHz	-	

1. Evaluated by characterization and not tested in production, unless otherwise specified.
2. In PLL mode, the MSI accuracy is the LSE crystal accuracy.
3. Specified by design. Not tested in production.
4. This is a deviation for an individual part once the initial frequency has been measured.
5. The MSI startup time is the time when the four MSIRCs are in power down.
6. This delay is the time to switch from one MSIRC to another one. In case the destination MSIRC is in power down, the total delay is $t_{su(MSI)} + t_{switch(MSI)}$.
7. The MSI is in continuous mode when the internal regulator is in voltage range 1, 2 or 3.
8. The MSI is in sampling mode when MSIBIAS = 1 in RCC_ICSCR1, and the regulator is in voltage range 4, or when the device is in Stop 1 or Stop 2 mode.
9. SMPS efficiency in range 1, based on V_{CORE} current = 19.4 mA.

High-speed internal 48 MHz (HSI48) RC oscillator

Table 83. HSI48 oscillator characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit

5.3.12 EMC characteristics

Susceptibility tests are performed on a sample basis during device characterization.

Functional EMS (electromagnetic susceptibility)

While a simple application is executed on the device (toggling two LEDs through the I/O ports), the device is stressed by two electromagnetic events until a failure occurs. The failure is indicated by the LEDs as follows:

- Electrostatic discharge (ESD) (positive and negative): applied to all device pins until a functional disturbance occurs. This test is compliant with the IEC 61000-4-2 standard.
- FTB (fast transient voltage burst) (positive and negative): applied to VDD and VSS pins through a 100 pF capacitor, until a functional disturbance occurs. This test is compliant with the IEC 61000-4-4 standard.

A device reset allows normal operations to be resumed.

The test results are given in the table below. They are based on the EMS levels and classes defined in application note *EMC design guide for STM8, STM32 and Legacy MCUs (*AN1709).

Table 88. EMS characteristics

Symbol	Parameter	Conditions	Level/ Class
V_{FESD}	Voltage limits to be applied on any I/O pin to induce a functional disturbance	V_{DD} = 3.3 V, T_A = +25 °C, f_{HCLK} = 160 MHz, TFBGA216 conforming to IEC 61000-4-2	3B
V_{EFTB}	Fast transient voltage burst limits to be applied through 100 pF on V_{DD} and V_{SS} pins to induce a functional disturbance	V_{DD} = 3.3 V, T_A = +25 °C, f_{HCLK} = 160 MHz, TFBGA216 conforming to IEC 61000-4-4	5A

Designing hardened software to avoid noise problems

The EMC characterization and optimization are performed at component level with a typical application environment and simplified MCU software. Note that good EMC performance is highly dependent on the user application and the software in particular.

Therefore it is recommended that the user applies EMC software optimization and prequalification tests in relation with the EMC level requested for the application.

Software recommendations

The software flowchart must include the management of runaway conditions such as:

- Corrupted program counter
- Unexpected reset
- Critical data corruption (control registers)

Prequalification trials

Most of the common failures (unexpected reset and program counter corruption) can be reproduced by manually forcing a low state on the NRST pin or the oscillator pins for 1 second.

To complete these trials, ESD stress can be applied directly on the device, over the range of specification values. When unexpected behavior is detected, the software can be hardened

Downloaded from Arrow.com.

to prevent unrecoverable errors occurring. See application note *Software techniques for improving microcontrollers EMC performance* (AN1015) for more details.

Electromagnetic Interference (EMI)

The electromagnetic field emitted by the device is monitored while a simple application is executed (toggling two LEDs through the I/O ports). This emission test is compliant with IEC 61967-2 standard that specifies the test board and the pin loading.

Table 89. EMI characteristics (for f_{HSE} = 8 MHz, f_{HCLK} = 160 MHz)

Symbol	Parameter	Conditions	Monitored frequency band	Value	Unit
S_{EMI}	Peak(1)	V_{DD} = 3.6 V, T_A = 25 °C, TFBGA216 package compliant with IEC 61967-2	0.1 MHz to 30 MHz	3	dBµV
			30 MHz to 130 MHz	13	
			130 MHz to 1 GHz	14	
			1 GHz to 2 GHz	11	
	Level(2)		0.1 MHz to 2 GHz	2.5	-

1. Refer to the 'EMI radiated test' section of the application note *EMC design guide for STM8, STM32 and legacy MCUs* (AN1709).
2. Refer to the 'EMI level classification' section of the same application note AN1709.

5.3.13 Electrical sensitivity characteristics

Based on three different tests (ESD, latch-up) using specific measurement methods, the device is stressed in order to determine its performance in terms of electrical sensitivity.

Electrostatic discharge (ESD)

Electrostatic discharges (a positive then a negative pulse separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size depends on the number of supply pins in the device (3 parts × (n+1) supply pins). This test conforms to the ANSI/JEDEC standard.

Table 90. ESD absolute maximum ratings

Symbol	Ratings	Conditions	Packages	Class	Max. value(1)	Unit
$V_{ESD(HBM)}$	Electrostatic discharge voltage (human body model)	T_A = +25 °C, conforming to ANSI/ESDA/JEDEC JS-001	All	2	2000	V
$V_{ESD(CDM)}$	Electrostatic discharge voltage (charge device model)	T_A = +25 °C, conforming to ANSI/ESDA/JEDEC JS-002	LPQF100	C2a	500	
			LQFP144	C1	250	
			UFBGA144	TBD	TBD	
			WLCSP208	C1	250	
			TFBGA216	C2a	500	

1. Evaluated by characterization. Not tested in production.

Downloaded from Arrow.com.

Static latch-up

The following complementary static tests are required on three parts to assess the latch-up performance:

- A supply overvoltage is applied to each power supply pin.
- A current injection is applied to each input, output and configurable I/O pin.

These tests are compliant with EIA/JESD 78E IC latch-up standard.

Table 91. Electrical sensitivities(1)

Symbol	Parameter	Conditions	Class
LU	Static latch-up class	T_J = 130 °C conforming to JESD78E	Class II level A

1. Evaluated by characterization. Not tested in production.

5.3.14 I/O current injection characteristics

As a general rule, the current injection to the I/O pins, due to external voltage below V_{SS} or above V_{DDIOx} (for standard, 3.3 V-capable I/O pins) must be avoided during normal product operation. However, in order to give an indication of the robustness of the microcontroller if abnormal injection accidentally happens, some susceptibility tests are performed on a sample basis during the device characterization.

Functional susceptibility to I/O current injection

While a simple application is executed on the device, the device is stressed by injecting current into the I/O pins programmed in floating-input mode. While this current is injected into the I/O pin, one at a time, the device is checked for functional failures.

The failure is indicated by an out-of-range parameter, such as an ADC error above a certain limit (higher than 5 LSB TUE), out of conventional limits of induced leakage current on adjacent pins (out of the -5 µA/+0 µA range), or other functional failure (for example reset occurrence or oscillator frequency deviation).

Downloaded from Arrow.com.

The characterization results are given in the table below. The negative induced leakage current is caused by the negative injection.The positive induced leakage current is caused by the positive injection.

Table 92. I/O current injection susceptibility(1)(2)

Symbol	Description	Functional susceptibility		Unit
		Negative injection	Positive injection	
I_{INJ}	Injected current on all pins except TT_a, PA4, PA5, DSI_DN_DL1, DSI_DP_DL1, DSI_DN_CL1, DSI_DP_CL1, DSI_DN_DL2, DSI_DP_DL2, OPAMP1_VINM, OPAMP2_VINM, PA11, PA12, PE11, PE12, PE7,PB14, PB5, PA1	5	NA	mA
	Injected current on TT_a, PA4, PA5, DSI_DN_DL1, DSI_DP_DL1, DSI_DN_CL1, DSI_DP_CL1, DSI_DN_DL2, DSI_DP_DL2, OPAMP1_VINM, OPAMP2_VINM, PA11, PA12 pins	0	0	
	Injected current on PE11, PE12, PE7 pins	0	NA	
	Injected current on PB14, PB5, PA1 pins	5	0	

1. Evaluated by characterization. Not tested in production.
2. The I/O structure options listed in this table can be a concatenation of options including the option explicitly listed. For instance TT_a refers to any TT I/O with _a option. TT_xx refers to any TT I/O and FT_xx refers to any FT I/O.

5.3.15 I/O port characteristics

General input/output characteristics

Unless otherwise specified, the parameters given in the table below are derived from tests performed under the conditions summarized in *Table 32*. All I/Os are designed as CMOS -and TTL-compliant.

Note: For information on GPIO configuration, refer to the application note 'STM32 GPIO configuration for hardware settings and low-power consumption' (AN4899).

Table 93. I/O static characteristics(1)

Sym-bol	Parameter	Conditions	Min	Typ	Max	Unit
V_{IL}(2)	I/O input low-level voltage	1.08 V ≤ V_{DDIOx} ≤ 3.6 V	-	-	0.3 V_{DDIOx}	V
		All I/Os except FT_c	-	-	0.38 V_{DDIOx}(3)	
		FT_c I/Os	-	-	0.3 V_{DDIOx}	
V_{IH}(2)	I/O input high-level voltage	1.08 V ≤ V_{DDIOx} ≤ 3.6 V	0.7 V_{DDIOx}	-	-	
		All I/Os except FT_c	0.5 V_{DDIOx} + 0.2(3)	-	-	
		FT_c I/Os	0.7 V_{DDIOx}	-	-	
V_{hys}(3)	Input hysteresis	TT_xx, FT_xx I/Os	-	250	-	mV

Downloaded from Arrow.com.

Table 93. I/O static characteristics(1) (continued)

Sym-bol	Parameter	Conditions		Min	Typ	Max	Unit
I_{lkg} (3)(4)	Input leakage current	all I/Os except FT_u, FT_c, FT_d, FT_t, TT_xx	$V_{IN} \le$ Max (V_{DDXXX})(5)	-	-	150	nA
			Max (V_{DDXXX}) < V_{IN} ≤ Max (V_{DDXXX}) + 1 V(6)	-	-	2000	
			Max (V_{DDXXX}) + 1 V < V_{IN} ≤ 5.5 V(6)	-	-	500	
		FT_u I/Os	$V_{IN} \le$ Max (V_{DDXXX})(5)	-	-	200	
			Max (V_{DDXXX}) < V_{IN} ≤ Max (V_{DDXXX}) + 1 V(6)	-	-	2500	
			Max (V_{DDXXX}) + 1 V < V_{IN} ≤ 5.5 V(6)	-	-	500	
		FT_c I/Os	$V_{IN} \le$ Max (V_{DDXXX})	-	-	1500	
			Max (V_{DDXXX}) < $V_{IN} \le$ 5 V(6)	-	-	2000	
		FT_d I/Os	$V_{IN} \le$ Max (V_{DDXXX})	-	-	1500	
			Max (V_{DDXXX}) < $V_{IN} \le$ 5.5 V(6)	-	-	5000	
		FT_t I/Os	$V_{IN} \le$ Max (V_{DDXXX})	-	-	300	
			Max (V_{DDXXX}) < V_{IN} ≤ Max (V_{DDXXX}) + 1 V(6)	-	-	3000	
			Max (V_{DDXXX}) + 1 V < V_{IN} ≤ 5.5 V(6)	-	-	600	
I_{lkg} (3)(4)	Input leakage current	TT_xx I/Os except OPAMPx_VINM (x = 1, 2)	$V_{IN} \le$ Max (V_{DDXXX})	-	-	500	
		OPAMPx_VINM (x = 1, 2) dedicated input leakage current		-	-	(7)	
R_{PU}	Weak pull-up equivalent	-		30	40	50	kΩ
R_{PD}	Weak pull-down equivalent resistor(8)	-		30	40	50	
C_{IO}	I/O pin capacitance	-		-	5	-	pF

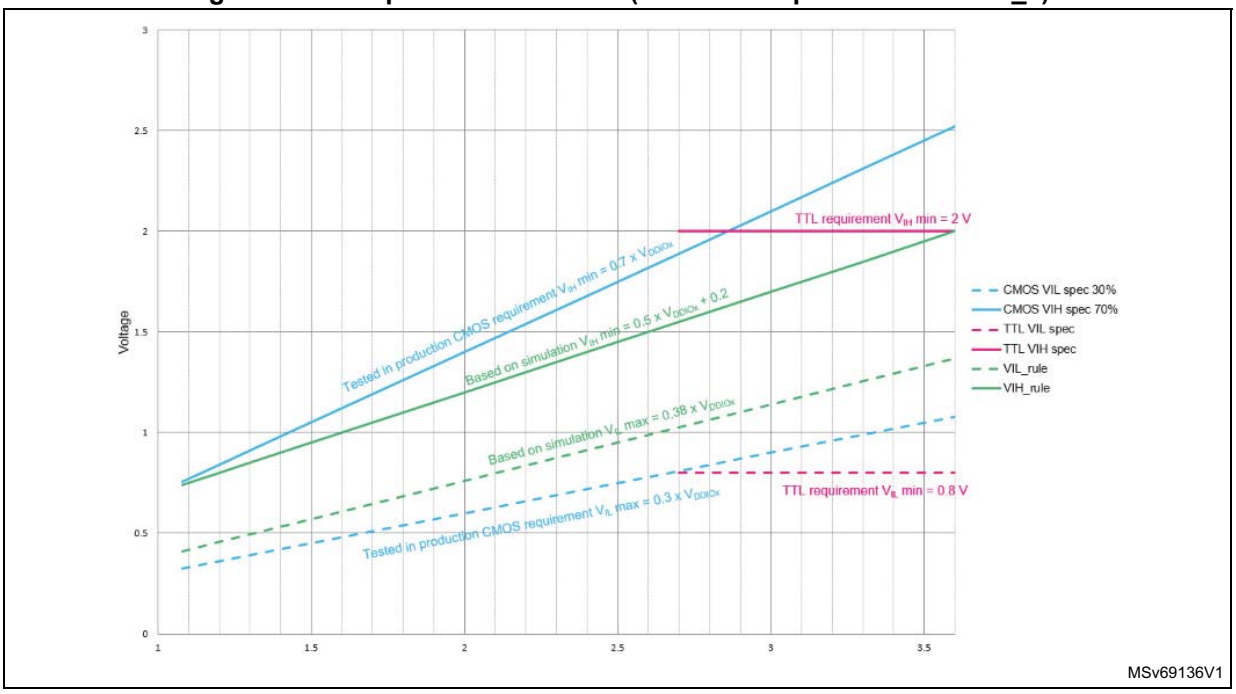
1. The I/O structure options listed in this table can be a concatenation of options including the option explicitly listed. For instance TT_a refers to any TT I/O with _a option. TT_xx refers to any TT I/O and FT_xx refers to any FT I/O.
2. Refer to *Figure 27: I/O input characteristics (all I/Os except BOOT0 and FT_c)*.
3. Specified by design. Not tested in production.
4. This parameter represents the pad leakage of the I/O itself. The total product pad leakage is provided by the following formula: $I_{Total_Ileak_max}$ = 10 µA + [number of I/Os where VIN is applied on the pad] x I_{lkg} max.
5. Max (V_{DDXXX}) is the maximum value of all the I/O supplies. The I/O supplies depend on the I/O structure options, as described in *Table 25: Legend/abbreviations used in the pinout table*.
6. To sustain a voltage higher than Min (V_{DD}, V_{DDA}, V_{DDUSB}, V_{DDIO2}) +0.3 V, the internal pull-up and pull-down resistors must be disabled.

Downloaded from Arrow.com.

7. Refer to I_{bias} in the OPAMP characteristics table for the values of the OPAMP dedicated input leakage current.
8. The pull-up and pull-down resistors are designed with a true resistance in series with a switchable PMOS/NMOS. This PMOS/NMOS contribution to the series resistance is minimal (~10% order).

All I/Os are CMOS- and TTL-compliant (no software configuration required). Their characteristics cover more than the strict CMOS-technology or TTL parameters. The coverage of these requirements is shown in the figure below.

Figure 27. I/O input characteristics (all I/Os except BOOT0 and FT_c)



Output driving current

The GPIOs (except PC13, PC14, PC15) can sink or source up to ±8 mA, and sink or source up to ± 20 mA (with a relaxed V_{OL}/V_{OH}). PC13, PC14, PC15 are limited in source capability: +3 mA shared between the three I/Os. These GPIOs have the same sink capability than other GPIOs.

In the user application, the number of I/O pins tat can drive current must be limited to respect the absolute maximum rating specified in *Section 5.2: Absolute maximum ratings*:

- The sum of the currents sourced by all the I/Os on $V_{DDIOx,}$ plus the maximum consumption of the MCU sourced on $V_{DD,}$ cannot exceed the absolute maximum rating ΣI_{VDD} (see *Table 30: Current characteristics*).
- The sum of the currents sunk by all the I/Os on V_{SS}, plus the maximum consumption of the MCU sunk on V_{SS}, cannot exceed the absolute maximum rating ΣI_{VSS} (see *Table 30: Current characteristics*).

Downloaded from Arrow.com.

Output voltage levels

Unless otherwise specified, the parameters given in the table below are derived from tests performed under the ambient temperature and supply voltage conditions summarized in *Table 32*. All I/Os are CMOS- and TTL-compliant (FT OR TT unless otherwise specified).

Table 94. Output voltage characteristics (all I/Os except FT_t I/Os in V_{BAT} mode(1) and FT_o I/Os) (2)(3)

Symbol	Parameter	Conditions	Min	Max	Unit
V_{OL}	Output low-level voltage	CMOS port(4), $\|I_{IO}\|$ = 8 mA, 2.7 V ≤ V_{DDIOx} ≤ 3.6 V	-	0.4	V
V_{OH}	Output high-level voltage		V_{DDIOx} - 0.4	-	
V_{OL}(5)	Output low-level voltage	TTL port(4),$\|I_{IO}\|$ = 8 mA, 2.7 V ≤ V_{DDIOx} ≤ 3.6 V	-	0.4	
V_{OH}(5)	Output high-level voltage		2.4	-	
V_{OL}(5)	Output low-level voltage	All I/Os, $\|I_{IO}\|$ = 20 mA, 2.7 V ≤ V_{DDIOx} ≤ 3.6 V	-	1.3	
V_{OH}(5)	Output high-level voltage		V_{DDIOx} - 1.3	-	
V_{OL}(5)	Output low-level voltage	$\|I_{IO}\|$ = 4 mA, 1.58 V ≤ V_{DDIOx} ≤ 3.6 V	-	0.4	
V_{OH}(5)	Output high-level voltage		V_{DDIOx} - 0.4	-	
V_{OL}(5)	Output low-level voltage	$\|I_{IO}\|$ = 1 mA, 1.08 V ≤ V_{DDIOx} <3.6 V	-	0.4	
V_{OH}(5)	Output high-level voltage		V_{DDIOx} - 0.4	-	
V_{OLFM+}(5)	Output low-level voltage for a FT_f I/O pin in FM+ mode	$\|I_{IO}\|$ = 20 mA, 2.7 V ≤ V_{DDIOx} ≤ 3.6 V	-	0.4	
		$\|I_{IO}\|$ = 10 mA, 1.58 V ≤ V_{DDIOx} ≤ 3.6 V	-	0.4	
		$\|I_{IO}\|$ = 2 mA, 1.08 V ≤ V_{DDIOx} < 3.6 V	-	0.4	

1. FT_t I/O characteristics are degraded only in V_{BAT} mode (refer to *Table 95*).
2. The I/O structure options listed in this table can be a concatenation of options including the option explicitly listed. For instance TT_a refers to any TT I/O with _a option. TT_xx refers to any TT I/O and FT_xx refers to any FT I/O.
3. The I_{IO} current sourced or sunk by the device must always respect the absolute maximum rating specified in *Table 30: Current characteristics*, and the sum of the currents sourced or sunk by all the I/Os (I/O ports and control pins) must always respect the absolute maximum ratings ΣI_{IO}.
4. TTL and CMOS outputs are compatible with JEDEC standards JESD36 and JESD52.
5. Specified by design. Not tested in production.

Table 95. Output voltage characteristics for FT_t I/Os in V_{BAT} mode, and for FT_o I/Os(1)

Symbol	Parameter	Conditions	Min	Max	Unit
V_{OL}	Output low-level voltage	$\|I_{IO}\|$ = 0.5 mA, 2.7 V ≤ V_{SW} ≤ 3.6 V	-	0.4	V
V_{OH}	Output high-level voltage		V_{SW} - 0.4	-	
V_{OL}	Output low-level voltage	$\|I_{IO}\|$ = 0.25 mA, 1.58 V ≤ V_{SW}≤ 3.6 V	-	0.4	
V_{OH}	Output high-level voltage		V_{SW} - 0.4	-	

1. Specified by design. Not tested in production.

	t_f	Output fall time(6)	C_L = 100 pF, 1.58 V ≤ V_{DDIOx} < 3.6 V	-	50	ns
			C_L = 100 pF, 1.08 V ≤ V_{DDIOx} < 1.58 V	-	80	
			C_L = 550 pF, 1.58 V ≤ V_{DDIOx} < 3.6 V	-	100	
			C_L = 550 pF, 1.08 V ≤ V_{DDIOx} < 1.58 V	-	220	

1. FT_t I/O characteristics are degraded only in V_{BAT} mode (refer to *Table 99*).
2. The I/O structure options listed in this table can be a concatenation of options including the option explicitly listed. For instance TT_a refers to any TT I/O with _a option. TT_xx refers to any TT I/O and FT_xx refers to any FT I/O.
3. The I/O speed is configured using the OSPEEDRy[1:0] bits. Refer to the product reference manual for a description of GPIO port configuration register.
4. Specified by design. Not tested in production.
5. Compensation system enabled.
6. The fall time is defined between 70% and 30% of the output waveform accordingly to I^2C specification.

Table 97. Output AC characteristics, HSLV ON (all I/Os except FT_c)(1)(2)(3)(4)

Speed	Symbol	Parameter	Conditions	Min	Max	Unit

Downloaded from Arrow.com.

5.3.16 NRST pin characteristics

The NRST pin input driver uses the CMOS technology. It is connected to a permanent pull-up resistor, R_{PU}.

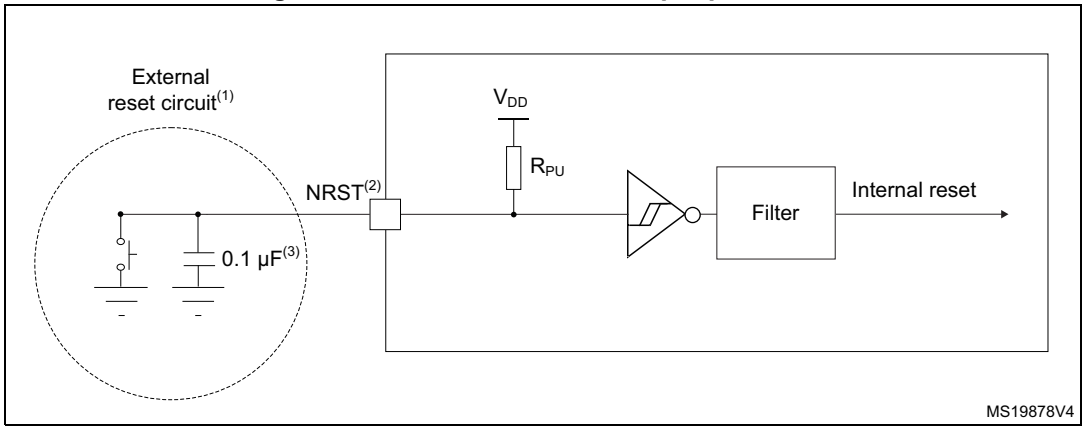
Unless otherwise specified, the parameters given in the table below are derived from tests performed under the ambient temperature and supply voltage conditions summarized in *Table 32*.

Table 100. NRST pin characteristics(1)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{IL(NRST)}$	NRST input low-level voltage	-	-	-	$0.3 \times V_{DD}$	V
$V_{IH(NRST)}$	NRST input high-level voltage	-	$0.7 \times V_{DD}$	-	-	
$V_{hys(NRST)}$	NRST Schmitt trigger voltage hysteresis	-	-	200	-	mV
R_{PU}	Weak pull-up equivalent resistor(2)	$V_{IN} = V_{SS}$	30	40	50	kΩ
$t_{F(NRST)}$	NRST input filtered pulse	-	-	-	50	ns
$t_{NF(NRST)}$	NRST input not-filtered pulse	$1.71\ V \le V_{DD} \le 3.6\ V$	330	-	-	
		$1.58\ V \le V_{DD} \le 3.6\ V$	1000	-	-	

1. Specified by design. Not tested in production.
2. The pull-up is designed with a true resistance in series with a switchable PMOS. This PMOS contribution to the series resistance is minimal (~10% order).

Figure 29. Recommended NRST pin protection



1. The reset network protects the device against parasitic resets.
2. The user must ensure that the level on the NRST pin can go below the $V_{IL(NRST)}$ max level specified in the above table. Otherwise, the reset is not taken into account by the device.
3. The external capacitor on NRST must be placed as close as possible to the device.

Downloaded from Arrow.com.

5.3.17 Extended interrupt and event controller input (EXTI) characteristics

The pulse on the interrupt input must have a minimal length in order to guarantee that it is detected by the event controller.

Table 101. EXTI input characteristics(1)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
PLEC	Pulse length to event controller	-	20	-	-	ns

1. Specified by design. Not tested in production.

5.3.18 Analog switches booster

Table 102. Analog switches booster characteristics(1)

Symbol	Parameter	Min	Typ	Max	Unit
V_{DD}	Supply voltage	1.6	1.8	3.6	V
$t_{SU(BOOST)}$	Booster startup time	-	-	50	µs
$I_{DD(BOOST)}$	Booster consumption	-	-	125	µA

1. Specified by design. Not tested in production.

5.3.19 14-bit analog-to-digital converter (ADC12) characteristics

Unless otherwise specified, the parameters given in the table below are values derived from tests performed under ambient temperature, f_{HCLK} frequency, and V_{DDA} supply voltage conditions summarized in *Table 32*.

Note: It is recommended to perform a calibration after each power-up.

Table 103. 14-bit ADC12 characteristics(1)(2)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{DDA}	Analog power supply for ADC ON	-	1.62	-	3.6	V
V_{REF+}	Positive reference voltage	$V_{DDA} \geq 2$ V	2	-	V_{DDA}	
		$V_{DDA} < 2$ V	V_{DDA}			
V_{REF-}	Negative reference voltage	-	V_{SSA}			
f_{ADC}	ADC clock frequency	1.62 V ≤ V_{DDA} ≤ 3.6 V	5(3)	-	55	MHz
	ADC clock ratio	-	45	-	55	%
f_s	Sampling rate	Resolution = 14 bits	0.23	-	2.5	Msps
		Resolution = 12 bits	0.25	-	2.75	
		Resolution = 10 bits	0.28	-	3.05	
		Resolution = 8 bits	0.31	-	3.44	
t_{TRIG}	External trigger period	Resolution = 14 bits	26	-	-	$1/f_{ADC}$
V_{AIN}(4)	Conversion voltage range	-	0	-	V_{REF+}	V

Downloaded from Arrow.com.

Table 103. 14-bit ADC12 characteristics(1)(2) (continued)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{CIMV}	Common mode input voltage	-	$V_{REF+}/2$ - 10%	$V_{REF+}/2$	$V_{REF+}/2$ + 10%	V
R_{AIN}(5)	External input impedance	Resolution = 14 bits T_j = 130 °C	-	-	1000	Ω
		Resolution = 12 bits T_j = 130 °C	-	-	1000	
		Resolution = 10 bits T_j = 130 °C	-	-	4700	
		Resolution = 8 bits T_j = 130 °C	-	-	22000	
C_{ADC}	Internal sample-and-hold capacitor	-	-	5	-	pF
$t_{ADCVREG_STUP}$	ADC LDO startup time	-	-	-	17	µs
t_{STAB}	ADC power-up time	LDO already started	(3 × 1/f_{ADC}) + 1 conversion			Cycle
t_{CAL}	Offset and linearity calibration time	-	31849			1/f_{ADC}
t_{OFF_CAL}	Offset calibration time	-	885			
t_{LATR}	Trigger conversion latency for regular and injected channels, without aborting the conversion	PRESC = 0	3			
		PRESC = 1	7			
		PRESC = 2	13			
$t_{LATRINJ}$	Trigger conversion latency Injected channels aborting a regular conversion	PRESC = 0	4			
		PRESC = 1	9			
		PRESC = 2	17			
t_s	Sampling time	-	5	-	814	
t_{CONV}	Total conversion time (including sampling time)	Resolution = N bits	t_s + N + 3			

Downloaded from Arrow.com.

Table 103. 14-bit ADC12 characteristics(1)(2) (continued)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$I_{DDA_D(ADC)}$	ADC consumption on V_{DDA} Differential mode	f_s = 2.5 Msps, resolution = 14 bits	-	970	-	µA
		f_s = 1 Msps, resolution = 14 bits	-	550	-	
		f_s = 10 ksps, resolution = 14 bits	-	130	-	
		f_s = 2.5 Msps, resolution = 12 bits	-	940	-	
		f_s = 2.5 Msps, resolution = 10 bits	-	840	-	
		f_s = 2.5 Msps, resolution = 8bits	-	730	-	
$I_{DDV_D(ADC)}$	ADC consumption on V_{REF+} Differential mode	f_s = 2.5 Msps, resolution = 14 bits	-	140	-	
		f_s = 1 Msps, resolution = 14 bits	-	80	-	
		f_s = 10 ksps, resolution = 14 bits	-	13	-	
		f_s = 2.5 Msps, resolution = 12 bits	-	140	-	
		f_s = 2.5 Msps, resolution = 10 bits	-	140	-	
		f_s = 2.5 Msps, resolution = 8bits	-	120	-	
$I_{DDA_s(ADC)}$	ADC consumption on V_{DDA} Singe-ended mode	f_s = 2.5 Msps, resolution = 14 bits	-	980	-	
		f_s = 1 Msps, resolution = 14 bits	-	550	-	
		f_s = 10 ksps, resolution = 14 bits	-	130	-	
		f_s = 2.5 Msps, resolution = 12 bits	-	900	-	
		f_s = 2.5 Msps, resolution = 10 bits	-	840	-	
		f_s = 2.5 Msps, resolution = 8bits	-	770	-	

Downloaded from Arrow.com.

Table 103. 14-bit ADC12 characteristics(1)(2) (continued)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$I_{DDV_s(ADC)}$	ADC consumption on V_{REF+} Single-ended mode	f_s = 2.5 Msps, resolution = 14 bits	-	160	-	µA
		f_s = 1 Msps, resolution = 14 bits	-	90	-	
		f_s = 10 ksps, resolution = 14 bits	-	15	-	
		f_s = 2.5 Msps, resolution = 12 bits	-	150	-	
		f_s = 2.5 Msps, resolution = 10 bits	-	150	-	
		f_s = 2.5 Msps, resolution = 8bits	-	150	-	

1. Specified by design. Not tested in production.
2. The voltage booster on the ADC switches must be used when V_{DDA} < 2.4 V (embedded I/O switches).
3. Degraded differential linearity error below 10 MHz.
4. Depending on the package, V_{REF+} can be internally connected to V_{DDA} and V_{REF-} can be internally connected to V_{SSA}.
5. The maximum value of R_{ain} is specified to keep leakage induced offset within the specified tolerance. The tolerance is 4 LSBs for 14-bit resolution and 2 LSBs for 12-bit, 10-bit, and 8-bit resolutions.

The maximum value of R_{AIN} can be found in the table below.

Table 104. Maximum R_{AIN} for 14-bit ADC12(1)(2)(3)

Resolution(4)	R_{AIN} max (Ω)(5)	Sampling time [ns]	Sampling cycle at 5 MHz	Sampling cycle at 55 MHz
14 bits	47	142	5	12
	68	145		
	100	170		
12 bits	47	135	5	12
	68	135		
	100	140		
	150	145		
	220	150		
	330	155		
	470	180		

Downloaded from Arrow.com.

Table 104. Maximum R_{AIN} for 14-bit ADC12[(1)(2)(3)] (continued)

Resolution[(4)]	R_{AIN} max (Ω)[(5)]	Sampling time [ns]	Sampling cycle at 5 MHz	Sampling cycle at 55 MHz
10 bits	47	128	5	12
	68	130		
	100	132		
	150	134		
	220	140		
	330	146		
	470	160		
	680	176		12

SNR	Signal-to-noise ratio	Single ended		68	74	-	
		Differential		73	78	-	
THD	Total harmonic distortion	Single ended		-	-84	-80	
		Differential		-	-95	-89	

1. Evaluated by characterization for BGA packages. Not tested in production. The values for LQFP packages may differ.
2. ADC DC accuracy values are measured after the internal calibration.
3. The I/O analog switch voltage booster is enable when V_{DDA} < 2.4 V (BOOSTEN = 1 in SYSCFG_CFGR1 when V_{DDA} < 2.4 V). The booster is disabled when V_{DDA} ≥ 2.4 V. Resolution = 14 bits, no oversampling.
4. This parameter may degrade in case of digital activity on adjacent I/Os.

Downloaded from Arrow.com.

Figure 30. ADC accuracy characteristics

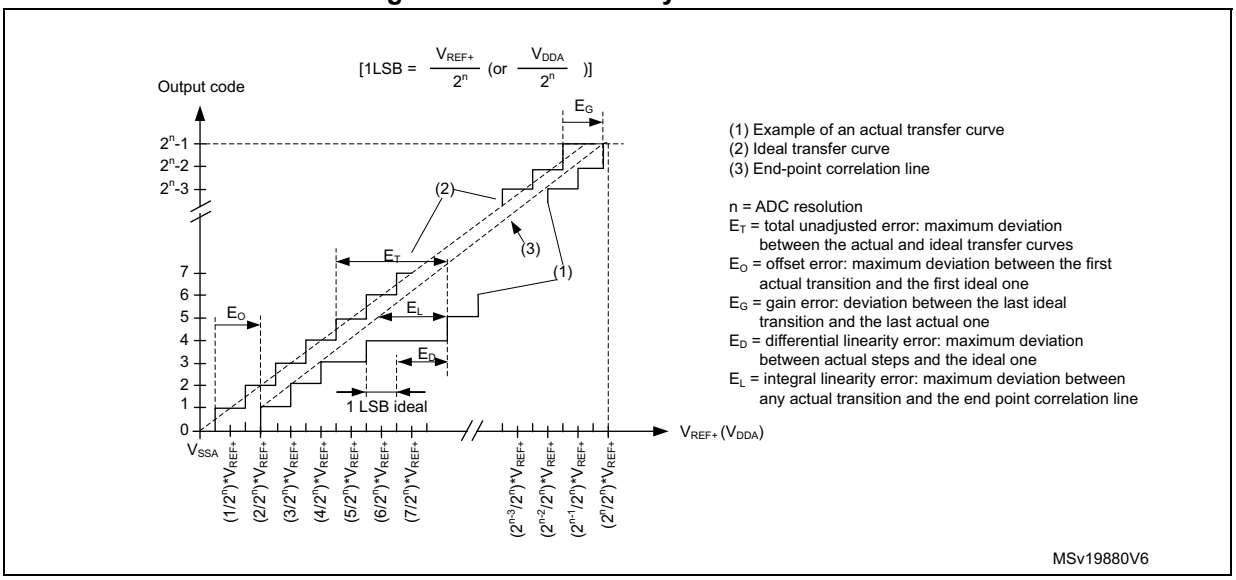

Figure 31. Typical connection diagram when using the ADC with FT/TT pins featuring analog switch function

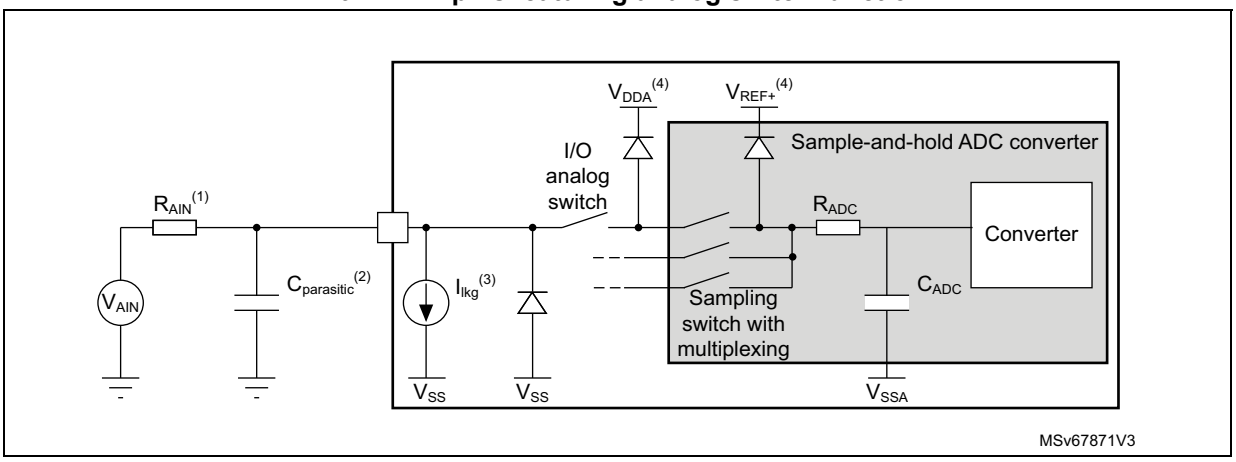

1. Refer to the ADCx characteristic table for the values of R_{AIN} and C_{ADC}.
2. $C_{parasitic}$ represents the capacitance of the PCB (dependent on soldering and PCB layout quality) plus the pad capacitance (refer to *Table 93: I/O static characteristics* for the value of the pad capacitance). A high $C_{parasitic}$ value downgrades the conversion accuracy. To remedy this, f_{ADC} must be reduced.
3. Refer to *Table 93: I/O static characteristics* for the values of I_{lkg}.
4. Refer to *Section 5.1.6: Power supply scheme*.

General PCB design guidelines

The power-supply decoupling must be performed as shown in the corresponding power-supply scheme. The 100 nF capacitor must be ceramic (good quality) and must be placed as close as possible to the chip.

Downloaded from Arrow.com.

5.3.20 12-bit analog-to-digital converter (ADC4) characteristics

Unless otherwise specified, the parameters given in the table below are values derived from tests performed under ambient temperature, f_{HCLK} frequency, and V_{DDA} supply voltage conditions summarized in *Table 32*.

Note: It is recommended to perform a calibration after each power-up.

Table 106. 12-bit ADC4 characteristics(1)(2)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{DDA}	Analog power supply for ADC ON	-	1.62	-	3.6	V
V_{REF+}	Positive reference voltage	-	1	-	V_{DDA}	
V_{REF-}	Negative reference voltage	-	V_{SSA}			
f_{ADC}	ADC clock frequency	1.62 V ≤ V_{DDA} ≤ 3.6 V	0.14	-	55	MHz
	ADC clock duty cycle	-	45	-	55	%
f_s	Sampling rate	Resolution = 12 bits	0.01	-	2.75	Msps
		Resolution = 10 bits	0.012	-	3.05	
		Resolution = 8 bits	0.014	-	3.43	
		Resolution = 6bits	0.0175	-	3.92	
t_{TRIG}	External trigger period	Resolution = 12 bits	16	-	-	$1/f_{ADC}$

		AUTOFF = 1, DPD = 1, no conversion	-	0.01	-	

1. Specified by design. Not tested in production.
2. The voltage booster on the ADC switches must be used when V_{DDA} < 2.4 V (embedded I/O switches).
3. Depending on the package, V_{REF+} can be internally connected to V_{DDA} and V_{REF-} can be internally connected to V_{SSA}.
4. The maximum value of R_{ain} is specified to keep leakage induced offset within the specified tolerance. The tolerance is 2 LSBs.

Downloaded from Arrow.com.

The maximum value of R_{AIN} can be found in the table below.

Table 107. Maximum R_{AIN} for 12-bit ADC4(1)(2)(3)

	33000	1853		814.5
	47000	2607	814.5	

1. Specified by design. Not tested in production.
2. BOOSTEN and ANASWVDD configured properly according to V_{DD} and V_{DDA} values.
3. Values without external capacitor.
4. The tolerance is 2 LSBs for 14 bits and 1 LSB for other resolutions.
5. The maximum value of R_{AIN} is obtained in a worst-case scenario: channel conversion in scan mode with channel i connected to V_{REF+} and channel i + 1 connected to V_{REF-}.

Table 108. 12-bit ADC4 accuracy(1)(2) (3)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
ET	Total unadjusted error	-	-	±3	±7.5	LSB
EO	Offset error	-	-	±2	±5.5	
EG	Gain error	-	-	±2	±6.5	
ED	Differential linearity error	-	-	-0.9/+1	-0.9/+1.5	
EL	Integral linearity error	-	-	±2	±3.5	
ENOB	Effective number of bits	-	9.9	10.9	-	bits
SINAD	Signal-to-noise and distortion ratio	-	61.4	67.4	-	dB
SNR	Signal-to-noise ratio	-	61.6	67.5	-	
THD	Total harmonic distortion	-	-	-74	-70	

1. Evaluated by characterization for BGA packages. Not tested in production. The values for LQFP packages may differ.
2. ADC DC accuracy values are measured after the internal calibration.
3. The I/O analog switch voltage booster is enabled when V_{DDA} < 2.4 V (BOOSTEN = 1 in SYSCFG_CFGR1 when V_{DDA} < 2.4 V). This switch is disabled when V_{DDA} ≥ 2.4 V. Resolution = 12 bits, no oversampling.

See *Figure 30: ADC accuracy characteristics*, *Figure 31: Typical connection diagram when using the ADC with FT/TT pins featuring analog switch function*, and *General PCB design guidelines*.

5.3.21 Temperature sensor characteristics

Table 109. Temperature sensor characteristics

Symbol	Parameter	Min	Typ	Max	Unit
T_L[1]	V_{SENSE} linearity with temperature	-	-	1.3	°C
Avg_Slope[1]	Average slope	2	2.5	3.0	mV/°C
V_{30}[2]	Voltage at 30°C (±5 °C)	700	752	800	mV
$\Delta(V_{continuous} - V_{sampling})$[3]	Difference of voltage between continuous and sampling modes[4]	-	-	-10/+4	
$t_{START_(TS_BUF)}$[3]	Sensor buffer startup time	-	1	10	µs
t_{S_temp}[3]	ADC sampling time when reading the temperature	13	-	-	
$I_{DD(TS)}$[3]	Temperature sensor consumption from V_{DD}, when selected by ADC	-	14	20	µA

1. Evaluated by characterization. Not tested in production.
2. Measured at $V_{REF+} = V_{DDA}$ = 3.0 V ±10 mV. The V_{30} A/D conversion result is stored in the TS_CAL1 byte. Refer to *Table 16: Temperature sensor calibration values*.
3. Specified by design. Not tested in production.
4. The temperature sensor is in continuous mode when the regulator is in range 1, 2 or 3. The temperature sensor is in sampling mode when the regulator is in range 4, or when the device is in Stop 1 or Stop 2 mode.

5.3.22 V_{CORE} monitoring characteristics

Table 110. V_{CORE} monitoring characteristics[1]

Symbol	Parameter	Min	Typ	Max	Unit
t_{S_VCORE}	ADC sampling time when reading the V_{CORE} voltage	1	-	-	µs

1. Specified by design. Not tested in production.

5.3.23 V_{BAT} monitoring characteristics

Table 111. V_{BAT} monitoring characteristics[1]

Symbol	Parameter	Min	Typ	Max	Unit
R	Resistor bridge for V_{BAT}	-	4 × 25.6	-	kΩ
Q	Ratio on V_{BAT} measurement	-	4	-	-
Er[2]	Error on Q	-5	-	5	%
t_{S_VBAT}[2]	ADC sampling time when reading the VBAT	5	-	-	µs

1. 1.58 V ≤ V_{BAT} ≤ 3.6 V
2. Specified by design. Not tested in production.

Downloaded from Arrow.com.

Table 112. V_{BAT} charging characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
R_{BC}	Battery charging resistor	VBRS = 0	-	5	-	kΩ
		VBRS = 1	-	1.5	-	

5.3.24 Digital-to-analog converter characteristics

Table 113. DAC characteristics(1)

Symbol	Parameter	Conditions		Min	Typ	Max	Unit
V_{DDA}	Analog supply voltage for DAC ON	-		1.6	-	3.6	V
V_{REF+}	Positive reference voltage	-		1.6	-	V_{DDA}	
V_{REF-}	Negative reference voltage	-		-	V_{SSA}	-	
R_L	Resistive load	DAC output buffer ON	connected to V_{SSA}	5	-	-	kΩ
			connected to V_{DDA}	25	-	-	
R_O	Output impedance	DAC output buffer OFF		10	13	16	
R_{BON}	Output impedance sample and hold mode, output buffer ON	V_{DDA} = 2.7 V		-	-	1.5	
		V_{DDA} = 2.0 V		-	-	2.5	
R_{BOFF}	Output impedance sample and hold mode, output buffer OFF	V_{DDA} = 2.7 V		-	-	16.5	
		V_{DDA} = 2.0 V		-	-	17.5	
C_L	Capacitive load	DAC output buffer OFF		-	-	50	pF
C_{SH}		Sample and hold mode		-	0.1	1	µF
V_{DAC_OUT}	Voltage on DAC_OUT output	DAC output buffer ON		0.2	-	V_{DDA} - 0.2	V
		DAC output buffer OFF		0	-	V_{REF+}	
$t_{SETTLING}$	Settling time (full scale: for a 12-bit code transition between the lowest and the highest input codes when DAC_OUT reaches the final value of ±0.5 LSB, ±1 LSB, ±2 LSB, ±4 LSB, or ±8 LSB)	Normal mode DAC output buffer ON C_L ≤ 50 pF, R_L ≥ 5 kΩ	±0.5 LSB	-	2.05	3.05	µs
			±1 LSB	-	1.90	3	
			±2 LSB	-	1.85	2.85	
			±4 LSB	-	1.80	2.8	
			±8 LSB	-	1.75	2.65	
		Normal mode DAC output buffer OFF, ±1 LSB, C_L = 10 pF		-	1.7	3	
t_{WAKEUP} (2)	Wake-up time from off state (setting the ENx bit in the DAC control register) until the final value ±1 LSB	Normal mode DAC output buffer ON, C_L ≤ 50 pF, R_L = 5 kΩ		-	4.2	7.5	
		Normal mode DAC output buffer OFF, C_L ≤ 10 pF		-	2	5	
PSRR	DC V_{DDA} supply rejection ratio	Normal mode DAC output buffer ON, C_L ≤ 50 pF, R_L = 5 kΩ		35	-80	-28	dB

Downloaded from Arrow.com.

Table 113. DAC characteristics(1) (continued)

Symbol	Parameter	Conditions		Min	Typ	Max	Unit
t_{SAMP}	Sampling time in sample and hold mode, C_{SH} = 100 nF (code transition between the lowest input code and the highest input code when DACOUT reaches the final value ±1 LSB)	DAC_OUT pin connected	DAC output buffer ON, C_{SH} = 100 nF	-	0.7	1.9	ms
			DAC output buffer OFF, C_{SH} = 100 nF	-	10.5	15	
		DAC_OUT pin not connected (internal connection only)	DAC output buffer OFF	-	2	8	µs
I_{leak}	Output leakage current	-		-	-	(3)	nA
CI_{int}	Internal sample and hold capacitor	-		7	9.2	11	pF
t_{TRIM}	Middle code offset trim time	DAC output buffer ON		50	-	-	µs
V_{offset}	Middle code offset for 1 trim code step	V_{REF+} = 3.6 V		-	1520	-	µV
		V_{REF+} = 1.6 V		-	680	-	
$I_{DDA(DAC)}$	DAC consumption from V_{DDA}	DAC output buffer ON	No load, middle code (0x800)	-	330	510	µA
			No load, worst code (0xF1C)	-	470	680	
		DAC output buffer OFF	No load, middle/worst code (0x800)	-	-	0.3	
		Sample and hold mode, C_{SH} = 100 nF		-	$330 \times T_{ON}/(T_{ON} + T_{OFF})$ (4)	$680 \times T_{ON}/(T_{ON} + T_{OFF})$ (4)	
$I_{DDV(DAC)}$	DAC consumption from V_{REF+}	DAC output buffer ON	No load, middle code (0x800)	-	170	240	
			No load, worst code (0x0E4)	-	300	400	
		DAC output buffer OFF	No load, middle/worst code (0x800)	-	145	180	
		Sample and hold mode, buffer ON, C_{SH} = 100 nF (worst code)		-	$170 \times T_{ON}/(T_{ON} + T_{OFF})$ (4)	$400 \times T_{ON}/(T_{ON} + T_{OFF})$ (4)	
		Sample and hold mode, buffer OFF, C_{SH} = 100 nF (worst code)		-	$145 \times T_{ON}/(T_{ON} + T_{OFF})$ (4)	$180 \times T_{ON}/(T_{ON} + T_{OFF})$ (4)	

1. Specified by design. Not tested in production.

Downloaded from Arrow.com.

2. In buffered mode, the output can overshoot above the final value for low input code (starting from the minimum value).
3. Refer to *Table 93: I/O static characteristics*.
4. T_{ON} is the refresh phase duration. T_{OFF} is the hold phase duration (see the product reference manual for more details).

Figure 32. 12-bit buffered/non-buffered DAC

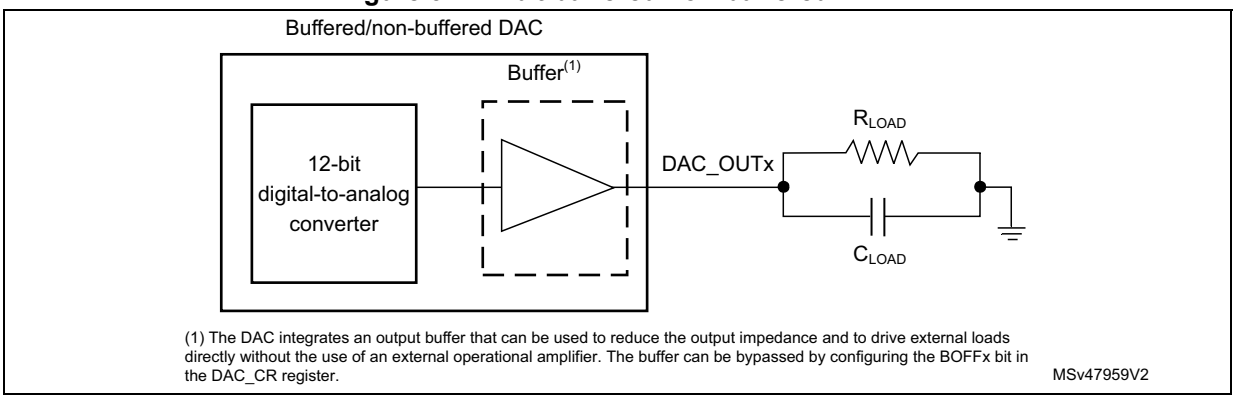

Table 114. DAC accuracy(1)

Symbol	Parameter	Conditions		Min	Typ	Max	Unit
DNL	Differential non-linearity(2)	DAC output buffer ON		-	-	±2	LSB
		DAC output buffer OFF		-	-	±2	
-	Monotonicity	10 bits		guaranteed			-
INL	Integral non-linearity(3)	DAC output buffer ON, $C_L \le 50$ pF, $R_L \ge 5$ kΩ		-	-	±4	LSB
		DAC output buffer OFF, $C_L \le 50$ pF, no R_L		-	-	±4	
Offset	Offset error at code 0x800(3)	DAC output buffer OFF, $C_L \le 50$ pF, no R_L		-	-	±8	
Offset1	Offset error at code 0x001(4)	DAC output buffer OFF, $C_L \le 50$ pF, no R_L		-	-	±5	
OffsetCal	Offset error at code 0x800(3) after calibration	DAC output buffer ON, $C_L \le 50$ pF, $R_L \ge 5$ kΩ	V_{REF+} = 3.6 V	-	-	±5	
			V_{REF+} = 1.6 V	-	-	±5	
Gain	Gain error(5)	DAC output buffer ON, $C_L \le 50$ pF, $R_L \ge 5$ kΩ		-	-	±0.5	%
		DAC output buffer OFF, $C_L \le 50$ pF, no R_L		-	-	±0.5	
TUE	Total unadjusted error	DAC output buffer OFF, $C_L \le 50$ pF, no R_L		-	-	±10	LSB
		DAC output buffer ON, $C_L \le 50$ pF, $R_L \ge 5$ kΩ, after calibration		-	-	±14	

Downloaded from Arrow.com.

Table 114. DAC accuracy(1) (continued)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
SNR	Signal-to-noise ratio(6)	DAC output buffer ON, $C_L \le 50$ pF, $R_L \ge 5$ kΩ, 1 kHz, BW = 500 kHz	-	70.6	-	dB
		DAC output buffer OFF, $C_L \le 50$ pF, no R_L, 1 kHz, BW = 500 kHz	-	72	-	
THD	Total harmonic distortion(6)	DAC output buffer ON, $C_L \le 50$ pF, $R_L \ge 5$ kΩ, 1 kHz	-	-79	-	
		DAC output buffer OFF, $C_L \le 50$ pF, no R_L, 1 kHz	-	-81	-	
SINAD	Signal-to-noise and distortion ratio(6)	DAC output buffer ON, $C_L \le 50$ pF, $R_L \ge 5$ kΩ, 1 kHz	-	70.1	-	
		DAC output buffer OFF, $C_L \le 50$ pF, no R_L, 1 kHz	-	71.5	-	
ENOB	Effective number of bits	DAC output buffer ON, $C_L \le 50$ pF, $R_L \ge 5$ kΩ, 1 kHz	-	11.3	-	bits
		DAC output buffer OFF, $C_L \le 50$ pF, no R_L, 1 kHz	-	11.6	-	

1. Specified by design. Not tested in production.
2. Difference between two consecutive codes minus 1 LSB.
3. Difference between the value measured at code i and the value measured at code i on a line drawn between code 0 and last code 4095.
4. Difference between the value measured at code (0x001) and the ideal value.
5. Difference between the ideal transfer-function slope and the measured slope computed from code 0x000 and 0xFFF when the buffer is OFF, and from code giving 0.2 V and (VREF+ - 0.2 V) when the buffer is ON.
6. Signal is -0.5 dBFS with Fsampling = 1 MHz.

5.3.25 Voltage reference buffer characteristics

Table 115. VREFBUF characteristics(1)

Symbol	Parameter	Conditions		Min	Typ	Max	Unit
V_{DDA}	Analog supply voltage	Normal mode	VRS = 000	1.8	-	3.6	V
			VRS = 001	2.1	-		
			VRS = 010	2.4	-		
			VRS = 011	2.8	-		
		Degraded mode(2)	VRS = 000	1.62	-	1.8	
			VRS = 001		-	2.1	
			VRS = 010		-	2.4	
			VRS = 011		-	2.8	
V_{REFBUF_OUT} (3)	Voltage reference buffer output	Normal mode at V_{DDA} = 3 V, T_J = 30 °C, I_{load} = 10 µA	VRS = 000	1.496	1.5	1.504	
			VRS = 001	1.795	1.8	1.805	
			VRS = 010	2.042	2.048	2.054	
			VRS = 011	2.493	2.5	2.507	

Downloaded from Arrow.com.

Table 115. VREFBUF characteristics(1) (continued)

Symbol	Parameter	Conditions		Min	Typ	Max	Unit
V_{REFBUF_OUT} (3) (cont'd)	Voltage reference buffer output	Degraded mode(2)	VRS = 000	Min (V_{DDA} - 0.15 ;1.496)	-	1.504	V
			VRS = 001	Min (V_{DDA} - 0.15 ;1.795)	-	1.805	
			VRS = 010	Min (V_{DDA} - 0.15 ;2.042)	-	2.054	
			VRS = 011	Min (V_{DDA} - 0.15 ;2.493)	-	2.507	
TRIM	Trim step	-		0.1	0.175	0.25	%
C_L	Load capacitor(4)	-		0.5	1.10	1.50	µF
esr	C_L equivalent serial resistor	-		-	-	2	Ω
I_{load}	Static load current	-		-	-	4	mA
R_{PD}	Pull-down resistance	-		-	-	400	Ω
I_{line_reg}	Line regulation	$V_{DDAmin} \leq V_{DDA} \leq 3.6$ V, Normal mode, 500 µA ≤ I_{load} ≤ 4 mA		±0.016	±0.033	±0.053	%
I_{load_reg}	Load regulation(5)	Normal mode, 500 µA ≤ I_{load} ≤ 4 mA		-	50	400	ppm/ mA
T_{Coeff}	Temperature coefficient	–40 °C < T_J < +130 °C		-	-	$T_{coeff_vrefint}$ + 50	ppm/ °C
PSRR	Power supply rejection	DC		-	65	-	dB
		100 kHz		-	30	-	
t_{START}	Startup time	C_L = 0.5 µF		-	110	200	µs
		C_L = 1.1 µF		-	240	350	
		C_L = 1.5 µF		-	320	500	
I_{INRUSH}	Control of DC current drive on V_{REFBUF_OUT} during startup phase (6)	-		-	8	11	mA
I_{DDA} (VREFBUF)	VREFBUF consumption from V_{DDA}	I_{load} = 0 µA		-	14	18	µA
		I_{load} = 500 µA		-	16	20	
		I_{load} = 4 mA		-	42	50	

1. Specified by design and not tested in production, unless otherwise specified.
2. In degraded mode, the voltage reference buffer can not accurately maintain the output voltage (V_{DDA} - drop voltage).
3. Evaluated by characterization. Not tested in production.
4. The capacitive load must include a 100 nF capacitor in order to cut off the high-frequency noise.
5. The load regulation value only takes into account the die and package resistance. The parasitic resistance on PCB degrades this value.
6. To correctly control the VREFBUF inrush current during startup phase and scaling change, the V_{DDA} voltage must be in the range of [1.8 V-3.6 V], [2.1 V-3.6 V], [2.4 V-3.6 V] and [2.8 V-3.6 V] for VRS = 000, 001, 010 and 011 respectively.

5.3.26 Comparator characteristics

Table 116. COMP characteristics(1)(2)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{DDA}	Analog supply voltage for COMP ON	-	1.58	-	3.6	V
V_{IN}	Comparator input voltage range	-	0	-	V_{DDA}	
V_{REFINT}(3)	Scaler input voltage	-	(3)			
V_{SC}	Scaler offset voltage	-	-	±5	±10	mV
$I_{DDA(SCALER)}$	Scaler static consumption from V_{DDA}	Scaler bridge disabled(4)	-	0.20	0.25	µA
		Scaler bridge enabled(5)	-	0.7	1	
t_{START_SCALER}	Scaler startup time	-	-	130	220	µs
t_{START}	Comparator startup time to reach propagation delay specification	High-speed mode	-	-	5	
		Medium mode	-	-	25	
		Ultra-low-power mode	-	-	80	
t_D(6)	Propagation delay for 200 mV step with 100 mV overdrive	High-speed mode	-	40	100	ns
		Medium mode	-	0.5	1	µs
		Ultra-low-power mode	-	2	7	
V_{offset}	Comparator offset error	Full common mode range	-	±5	±20	mV
V_{hys}	Comparator hysteresis	No hysteresis	-	0	-	
		Low hysteresis	-	15	-	
		Medium hysteresis	-	30	-	
		High hysteresis	-	45	-	
I_{bias}	Comparator input bias current	-	(7)			nA

Downloaded from Arrow.com.

Table 116. COMP characteristics(1)(2) (continued)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$I_{DDA(COMP)}$	Comparator consumption from V_{DDA}	High-speed mode, static	-	48	90	µA
		High-speed mode, with 50 kHz, ±100 mV overdrive square signal	-	50	-	
		Medium mode, static	-	3	6	
		Medium mode, with 50 kHz, ±100 mV overdrive square signal	-	3.75	-	
		Ultra-low-power mode, static	-	0.3	1	
		Ultra-low-power mode, with 50 kHz, ±100 mV overdrive square signal	-	0.65	-	

1. Specified by design and not tested in production, unless otherwise specified.
2. The input capacitance is negligible compared to the I/O capacitance.
3. Refer to *Table 36: Embedded internal voltage reference*.
4. No V_{REFINT} division, includes only buffer consumption.
5. V_{REFINT} division, includes resistor bridge and buffer consumption.
6. Evaluated by characterization. Not tested in production.
7. Mostly I/O leakage when used in analog mode. Refer to I_{lkg} parameter in *Table 93: I/O static characteristics*.

5.3.27 Operational amplifiers characteristics

Table 117. OPAMP characteristics(1)(2)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{DDA}	Analog supply voltage range for OPAMP ON	-	1.60	-	3.6	V
CMIR	Common mode input range	-	0	-	V_{DDA}	
VI_{OFFSET}	Input offset voltage	T_J = 30 °C, no load on output, Normal mode	-	-	±3	mV
		T_J= 30 °C, no load on output, Low-power mode	-	-	±3	
		All voltages and temperature, Normal mode	-	-	±7	
		All voltages and temperature, Low-power mode	-	-	±11.5	
ΔVI_{OFFSET}	Input offset voltage drift over temperature	Normal mode	-	±7	-	µV/°C
		Low-power mode	-	±15	-	
TRIMOFFSETP TRIMLPOFFSETP	Offset trim step at low common input voltage (0.1 × V_{DDA})	-	-	1.05	1.25	mV
TRIMOFFSETN TRIMLPOFFSETN	Offset trim step at high common input voltage (0.9 × V_{DDA})	-	-	1.05	1.25

5.3.28 Temperature and backup domain supply thresholds monitoring

The temperature and backup domain supply monitoring characteristics are provided in the technical note STM32U54xxx/STM32U58xxx/STM32U5Axxx/STM32U5Gxxx MCUs for PCI products (TN1333) (NDA required).

5.3.29 ADF/MDF characteristics

Unless otherwise specified, the parameters given in the table below are derived from tests performed under the ambient temperature, f_{AHB} frequency and V_{DD} supply voltage conditions summarized in *Table 32*, with the following configuration:

- Output speed set to OSPEEDRy[1:0] = 10
- Capacitive load C_L = 30 pF
- Measurement points done at 0.5 × V_{DD} level
- I/O compensation cell activated
- HSLV activated when V_{DD} ≤ 2.7 V
- Voltage scaling range 1

Refer to *Section 5.3.15: I/O port characteristics* for more details on the input/output alternate function characteristics.

Downloaded from Arrow.com.

Table 118. ADF characteristics(1)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_{CCKI}	Input clock frequency via ADF_CCK[1:0] pin, in SLAVE SPI mode	1.71 ≤ V_{DD} ≤ 3.6 V	-	-	25	MHz
f_{CCKO}	Output clock frequency in MASTER SPI mode		-	-	25	
f_{CCKOLF}	Output clock frequency in LF_MASTER SPI mode		-	-	5	
f_{SYMB}	Input symbol rate in Manchester mode		-	-	20	
t_{HCCKI} t_{LCCKI}	ADF_CCK[1:0] input clock high and low time	In SLAVE SPI mode	2 × Tadf_proc_ck(2)	-	-	ns
t_{HCCKO} t_{LCCKO}	ADF_CCK[1:0] output clock high and low time	In MASTER SPI mode	2 × Tadf_proc_ck	-	-	
$t_{HCCKOLF}$ $t_{LCCKOLF}$	ADF_CCK[1:0] output clock high and low time	In LF_MASTER SPI mode	Tadf_proc_ck	-	-	
t_{SUCCKI}	Data setup time with respect to ADF_CCK[1:0] input	In SLAVE SPI mode: ADF_CCK[1:0] configured in input, measured on rising and falling edge	4	-	-	
t_{HDCCKI}	Data hold time with respect to ADF_CCK[1:0] input		0	-	-	
t_{SUCCKO}	Data setup time with respect to ADF_CCK[1:0] output	In MASTER SPI mode: ADF_CCK[1:0] configured in output, measured on rising and falling edge	3.5	-	-	
t_{HDCCKO}	Data hold time with respect to ADF_CCK[1:0] output		0.5	-	-	
$t_{SUCCKOLF}$	Data setup time with respect to ADF_CCK[1:0] output	In LF_MASTER SPI mode: ADF_CCK[1:0] configured in output, measured on rising and falling edge	19.5	-	-	
$t_{HDCCKOLF}$	Data hold time with respect to ADF_CCK[1:0] output		0	-	-	

1. Evaluated by characterization. Not tested in production.
2. Tadf_proc_ck is the period of the ADF processing clock.

5.3.30 DCMI characteristics

Unless otherwise specified, the parameters given in the table below are derived from tests performed under the ambient temperature, f_{HCLK} frequency and V_{DD} supply voltage summarized in *Table 32*, with the following configuration:

- Output speed set to OSPEEDRy[1:0] = 10
- DCMI_PIXCLK polarity: falling
- DCMI_VSYNC and DCMI_HSYNC polarity: high
- Data formats: 14 bits
- Capacitive load C_L = 30 pF
- Measurement points done at 0.5 × V_{DD} level
- I/O compensation cell activated
- HSLV activated when V_{DD} ≤ 2.7 V
- Voltage scaling range 1

Table 120. DCMI characteristics(1)

Symbol	Parameter	Min	Max	Unit
-	Frequency ratio DCMI_PIXCLK/f_{HCLK}	-	0.4	-
DCMI_PIXCLK	Pixel clock input	-	64	MHz
D_{PIXEL}	Pixel clock input duty cycle	30	70	%
$t_{su(DATA)}$	Data input setup time	2.5	-	ns
$t_{h(DATA)}$	Data hold time	1	-	
$t_{su(HSYNC)}$ $t_{su(VSYNC)}$	DCMI_HSYNC and DCMI_VSYNC input setup times	2	-	
$t_{h(HSYNC)}$ $t_{h(VSYNC)}$	DCMI_HSYNC and DCMI_VSYNC input hold times	0	-	

1. Evaluated by characterization. Not tested in production.

5.3.31 PSSI characteristics

Unless otherwise specified, the parameters given in the table below are derived from tests performed under the ambient temperature, f_{HCLK} frequency and V_{DD} supply voltage summarized in *Table 32*, with the following configuration:

- Output speed set to OSPEEDRy[1:0] = 10
- PSSI_PDCK polarity: falling
- PSSI_RDY and PSSI_DE polarity: low
- Bus width: 16 lines
- Data width: 32 bits
- Capacitive load C_L = 30 pF
- Measurement points done at 0.5 × V_{DD} level
- I/O compensation cell activated
- HSLV activated when V_{DD} ≤ 2.7 V
- Voltage scaling range 1

Table 121. PSSI transmit characteristics(1)

Symbol	Parameter	Conditions	Min	Max	Unit
-	Frequency ratio DCMI_PDCK/f_{HCLK}	-	-	0.4	-
PSSI_PDCK	PSSI clock input	2.7 V ≤ V_{DD} ≤ 3.6 V	-	64(2)	MHz
		1.71 V ≤ V_{DD} ≤ 3.6 V	-	48.5(2)	
D_{PIXEL}	PSSI clock input duty cycle	-	30	70	%

Downloaded from Arrow.com.

Table 121. PSSI transmit characteristics(1) (continued)

Symbol	Parameter	Conditions	Min	Max	Unit
$t_{OV(DATA)}$	Data output valid time	2.7 V ≤ V_{DD} ≤ 3.6 V	-	13	ns
		1.71 V ≤ V_{DD} ≤ 3.6 V	-	20.5	
$t_{OH(DATA)}$	Data output hold time	1.71 V ≤ V_{DD} ≤ 3.6 V	7.5	-	
$t_{OV(DE)}$	DE output valid time		-	14	
$t_{OH(DE)}$	DE output hold time		6	-	
$t_{SU(RDY)}$	RDY input setup time		0	-	
$t_{H(RDY)}$	RDY input hold time		0	-	

1. Evaluated by characterization. Not tested in production.
2. This maximal frequency does not consider receiver setup and hold timings.

5.3.32 LCD-TFT controller (LTDC) characteristics

Unless otherwise specified, the parameters given in the table below are derived from tests performed under the ambient temperature, f_{HCLK} frequency and V_{DD} supply voltage summarized in *Table 32*, with the following configuration:

- LCD_CLK polarity: high
- LCD_DE polarity: low
- LCD_VSYNC and LCD_HSYNC polarity: high
- Pixel formats: 24 bits
- Output speed set to OSPEEDRy[1:0] = 10
- Capacitive load C_L = 30 pF
- Measurement points done at 0.5 × V_{DD} level
- I/O compensation cell activated
- HSLV activated when $V_{DD} \leq 2.7$ V
- Voltage scaling range 1

Table 123. LTDC characteristics(1)

Symbol	Parameter	Conditions	Min	Max	Unit
f_{CLK}	LTDC clock output frequency	2.7 V ≤ V_{DD} ≤ 3.6 V, C_L = 20 pF	-	116	MHz
		2.7 V ≤ V_{DD} ≤ 3.6 V		100	
		1.71 V ≤ V_{DD} ≤ 3.6 V		66.5	
D_{CLK}	LTDC clock output duty cycle		45	55	%
$t_{W(CLKH)}$ $t_{W(CLKL)}$	Clock High time, low time		$t_{W(CLK)}/2$ - 0.5	$t_{W(CLK)}/2$ + 0.5	ns
$t_{V(DATA)}$	Data output valid time	2.7 V ≤ V_{DD} ≤ 3.6 V	-	2.5	
		1.71 V ≤ V_{DD} ≤ 3.6 V		7.5	
$t_{H(DATA)}$	Data output hold time		0.5	-	
$t_{V(HSYNC)}$ $t_{V(VSYNC)}$ $t_{V(DE)}$	HSYNC/VSYNC/DE output valid time		-	3	
$t_{H(HSYNC)}$ $t_{H(VSYNC)}$ $t_{H(DE)}$	HSYNC/VSYNC/DE output hold time		1.5	-	

1. Evaluated by characterization. Not tested in production.

5.3.33 MIPI D-PHY characteristics

The parameters given in the table below are derived from tests performed under temperature and V_{DD} supply voltage conditions summarized in *Table 32*.

Table 124. MIPI D-PHY characteristics(1)

Symbol	Parameter	Min	Typ	Max	Unit
High-speed input/output characteristics					
U_{INST}(2)	UI instantaneous	2	-	12.5	ns
V_{CMTX}	High-speed transmit common mode voltage	150	200	250	mV
$\|\Delta V_{CMTX}\|$	V_{CMTX} mismatch when output is Differential-1 or Differential-0	-	-	5	
$\|V_{OD}\|$	High-speed transmit differential voltage	140	200	270	
$\|\Delta V_{OD}\|$	V_{OD} mismatch when output is Differential-1 or Differential-0	-	-	14	
V_{OHHS}	High-speed output high voltage	-	-	360	
Z_{OS}	Single-ended output impedance	40	50	62.5	Ω
ΔZ_{OS}	Single-ended output impedance mismatch	-	-	10	%
t_{HSr}, t_{HSf}(2)	20%-80% rise and fall time	100	-	0.3 × UI(3)	ps
Low-power receiver input characteristics					
V_{IL}	Logic 0 input voltage (not in ULP state)	-	-	550	mV
$V_{IL-ULPS}$	Logic 0 input voltage in ULP state	-	-	300	
V_{IH}	Input high-level voltage	880	-	-	
V_{hys}(2)	Voltage hysteresis	25	-	-	
Low-power emitter output characteristics					
V_{OL}	Output low level voltage	-50	-	50	mV
V_{OH}	Output high level voltage	1.1	1.2	1.2	V
Z_{OLP}	Output impedance of LP transmitter	110	-	-	Ω
t_{LPr}, t_{LPf}(2)	15%-85% rise and fall time	-	-	25	ns
Low-power contention detector characteristics					
V_{ILCD}	Logic 0 contention threshold	-	-	200	mV
V_{IHCD}	Logic 1 contention threshold	450	-	-	

1. Evaluated by characterization, not tested in production unless otherwise specified.
2. Specified by design. Not tested in production.
3. UI (unit interval) equals to the duration of any HS state on the clock lane.

Downloaded from Arrow.com.

Table 125. MIPI D-PHY AC characteristics LP mode and HS/LP transitions(1)

Symbol	Parameter	Min	Typ	Max	Unit
T_{LPX}	Transmitted length of any LP state period	50	-	-	ns
$T_{CLK-PREPARE}$	Time that the transmitter drives the clock lane LP-00 line state immediately before the HS-0 line state, starting the HS transmission	38	-	95	
$T_{CLK-PREPARE}$ + $T_{CLK-ZERO}$	$T_{CLK-PREPARE}$ + time that the transmitter drives the HS-0 state prior to starting the clock	300	-	-	
$T_{CLK-PRE}$	Time that the HS clock must be driven by the transmitter prior to any associated data lane beginning the transition from LP to HS mode	8	-	-	UI(2)
$T_{CLK-POST}$	Time that the transmitter continues to send HS clock after the last associated data lane transitioned to LP mode	62 + 52 × UI	-	-	ns
$T_{CLK-TRAIL}$	Time that the transmitter drives the HS-0 state after the last payload clock bit of an HS transmission burst	60	-	-	
$T_{HS-PREPARE}$	Time that the transmitter drives the data lane LP-00 line state immediately before the HS-0 line state starting the HS transmission	40 + 4 × UI	-	85 + 6 × UI	
$T_{HS-PREPARE}$ + $T_{HS-ZERO}$	$T_{HS-PREPARE}$ + time that the transmitter drives the HS-0 state prior to transmitting the sync sequence	145 + 10 × UI	-	-	
$T_{HS-TRAIL}$	Time that the transmitter drives the flipped differential state after last payload data bit of a HS transmission burst	Max (n × 8 × UI, 60 + n × 4 × UI)	-	-	
$T_{HS-EXIT}$	Time that the transmitter drives LP-11 following a HS burst	100	-	-	
T_{REOT}	30%-85% rise and fall time	-	-	35(3)	
T_{EOT}	Transmitted time interval from the start of $T_{HS-TRAIL}$ or $T_{CLK-TRAIL}$, to the start of the LP-11 state following a HS burst	-	-	105 + n × 12 × UI	

1. Evaluated by characterization. Not tested in production.
2. UI (unit interval) equals to the duration of any HS state on the clock lane.
3. For V_{DD} above 3 V, this parameter may be degraded in the 55°C to 125°C range. For V_{DD} = 1.8 V, this parameter may be degraded in the 25°C to 125°C range.

Table 128. DSI current consumption characteristics on $V_{DD11DSI}$(1) (continued)

Symbol	Parameter	Condition	Min	Typ	Max	Unit
I_{DD11_DSILP}	DSI system current consumption on $V_{DD11DSI}$ in LP mode communication(2)	10 MHz escape clock - 1 data lane (PLL OFF)	-	0.56	1.2	mA
		10 MHz escape clock - 2 data lanes (PLL OFF)	-	0.83	1.7	
		20 MHz escape clock - 1 data lane (PLL OFF)	-	0.56	1.2	
		20 MHz escape clock - 2 lanes (PLL OFF)	-	0.83	1.7	
I_{DD11_DSIHS}	DSI system (Host, PLL and D-PHY) current consumption on $V_{DD11DSI}$ in HS mode communication(3)	300 Mbit/s - 1 data lane (PLL ON)	-	6.45	8.5	
		300 Mbit/s - 2 data lanes (PLL ON)	-	7.8	10.3	
		500 Mbit/s - 1 data lane (PLL ON)	-	7.4	9.7	
		500 Mbit/s - 2 data lanes (PLL ON)	-	8.8	11.5	
	DSI system (Host, PLL and D-PHY) current consumption on $V_{DD11DSI}$ in HS mode with CLK like payload	500 Mbit/s - 2 data lanes (PLL ON)	-	10.1	13.3	

1. Evaluated by characterization. Not tested in production.
2. Values based on an average traffic in LP command mode.
3. Values based on an average traffic (3/4 HS traffic and 1/4 LP) in video mode.

5.3.34 Timer characteristics

The parameters given in the following tables are specified by design, not tested in production.

Refer to *Section 5.3.15: I/O port characteristics* for details on the input/output alternate function characteristics (output compare, input capture, external clock, PWM output).

Table 129. TIMx(1) characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
$t_{res(TIM)}$	Timer resolution time	-	1	-	$t_{TIMxCLK}$
		$f_{TIMxCLK}$ = 160 MHz	6.25	-	ns
f_{EXT}	Timer external clock frequency on CH1 to CH4	-	0	$f_{TIMxCLK}/2$	MHz
		$f_{TIMxCLK}$ = 160 MHz	0	80	
Res_{TIM}	Timer resolution	TIMx (except TIM2/3/4/5)	-	16	bit
		TIM2/3/4/5	-	32	
$t_{COUNTER}$	16-bit counter clock period	-	1	65536	$t_{TIMxCLK}$
		$f_{TIMxCLK}$ = 160 MHz	0.007	409.6	µs

Downloaded from Arrow.com.

Table 129. TIMx(1) characteristics (continued)

Symbol	Parameter	Conditions	Min	Max	Unit
t_{MAX_COUNT}	Maximum possible count with 32-bit counter	-	-	65536 × 65536	$t_{TIMxCLK}$
		$f_{TIMxCLK}$ = 160 MHz	-	26.843	s

1. TIMx is used as a general term in which x stands for 1, 2, 3, 4, 5, 6, 7, 8, 15, 16, or 17.

Table 130. IWDG min/max timeout period at 32 kHz (LSI)(1)

Prescaler divider	PR[2:0] bits	Min timeout RL[11:0] = 0x000	Max timeout RL[11:0] = 0xFFF	Unit
/4	0	0.125	512	ms
/8	1	0.250	1024	
/16	2	0.500	2048	
/32	3	1.0	4096	
/64	4	2.0	8192	
/128	5	4.0	16384	
/256	6 or 7	8.0	32768	

1. The exact timings still depend on the phasing of the APB interface clock versus the LSI clock, so that there is always a full RC period of uncertainty.

Table 131. WWDG min/max timeout value at 160 MHz (PCLK)

Prescaler	WDGTB	Min timeout value	Max timeout value	Unit
1	0	0.025	1.638	ms
2	1	0.051	3.276	
4	2	0.102	6.553	
8	3	0.204	13.107	
16	4	0.409	26.214	
32	5	0.819	52.428	
46	6	1.177	75.366	
128	7	3.276	209.715	

5.3.35 FSMC characteristics

Unless otherwise specified, the parameters given in the tables below are derived from tests performed under the ambient temperature, f_{HCLK} frequency and V_{DD} supply voltage conditions summarized in *Table 32*, with the following configuration:

- Output speed set to OSPEEDRy[1:0] = 10
- Capacitive load C_L = 30 pF, unless otherwise specified
- Measurement points done at 0.5 × V_{DD} level
- I/O compensation cell activated
- HSLV activated when V_{DD} ≤ 2.7 V
- Voltage scaling range 1

Downloaded from Arrow.com.

Refer to *Section 5.3.15: I/O port characteristics* for more details on the input/output characteristics.

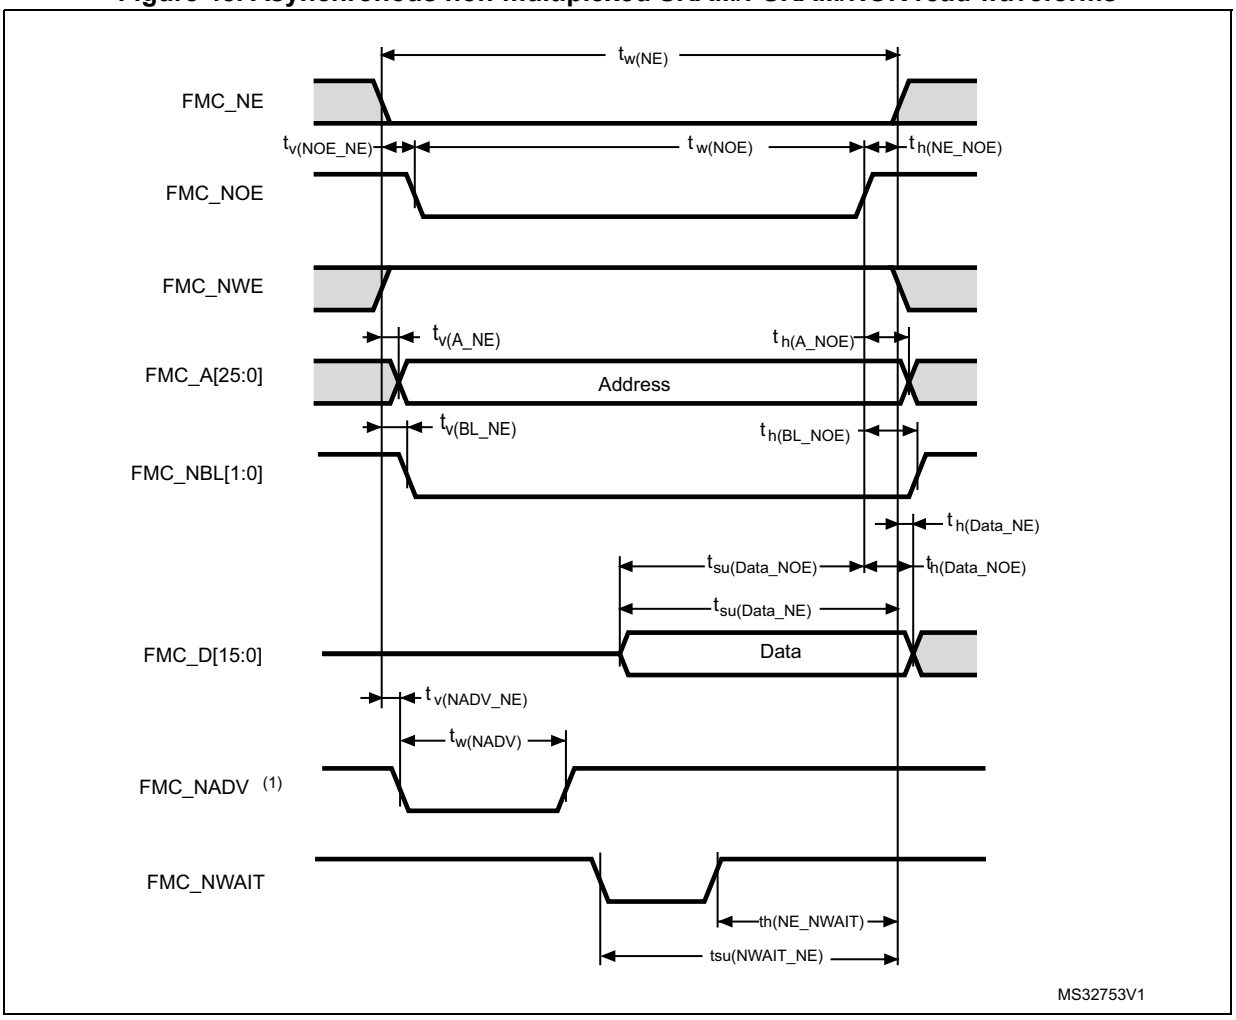
Asynchronous waveforms and timings

Figure 48 to *Figure 51* represent asynchronous waveforms and *Table 132* to *Table 139* provide the corresponding timings. The results shown in these tables are obtained with the following FMC configuration:

- AddressSetupTime (ADDSET) = 0x1
- AddressHoldTime (ADDHLD) = 0x1
- ByteLaneSetup (NBLSET) = 0x1
- DataSetupTime (DATAST) = 0x1 (except for asynchronous NWAIT mode, DataSetupTime = 0x5)
- DataHoldTime (DATAHLD) = 0x1 (0x0 for write operation)
- BusTurnAroundDuration = 0x0
- Capacitive load C_L = 30 pF

In all timing tables, the T_{HCLK} is the HCLK clock period.

Figure 48. Asynchronous non-multiplexed SRAM/PSRAM/NOR read waveforms



Downloaded from Arrow.com.

Table 132. Asynchronous non-multiplexed SRAM/PSRAM/NOR read timings(1)

Symbol	Parameter	Min	Max	Unit
$t_{w(NE)}$	FMC_NE low time	$3 \times t_{HCLK} - 1$	$3 \times t_{HCLK} + 1$	ns
$t_{v(NOE_NE)}$	FMC_NEx low to FMC_NOE low	0	5	
$t_{w(NOE)}$	FMC_NOE low time	$2 \times t_{HCLK} - 1$	$2 \times t_{HCLK} + 1$

Synchronous waveforms and timings

Figure 52 to *Figure 55* represent synchronous waveforms and *Table 140* to *Table 143* provide the corresponding timings. The results shown in these tables are obtained with the following FMC configuration:

- BurstAccessMode = FMC_BurstAccessMode_Enable
- MemoryType = FMC_MemoryType_CRAM
- WriteBurst = FMC_WriteBurst_Enable
- CLKDivision = 1
- DataLatency = 1 for NOR Flash; DataLatency = 0 for PSRAM

In all timing tables, the T_{HCLK} is the HCLK clock period.

- Maximum FMC_CLK = 80 MHz for 2.7 V ≤ V_{DD} ≤ 3.6 V, with C_L = 15pF and with C_L = 20 pF
- Maximum FMC_CLK = 80 MHz for 1.71 V ≤ V_{DD} ≤ 1.9 V with C_L = 15pF and with C_L = 20 pF

NAND controller waveforms and timings

Figure 56 to *Figure 59* represent synchronous waveforms, and *Table 144*/*Table 145* provide the corresponding timings. The results shown in these tables are obtained with the following FMC configuration:

- COM.FMC_SetupTime = 0x01
- COM.FMC_WaitSetupTime = 0x03
- COM.FMC_HoldSetupTime = 0x02
- COM.FMC_HiZSetupTime = 0x01
- ATT.FMC_SetupTime = 0x01
- ATT.FMC_WaitSetupTime = 0x03
- ATT.FMC_HoldSetupTime = 0x02
- ATT.FMC_HiZSetupTime = 0x01
- Bank = FMC_Bank_NAND
- MemoryDataWidth = FMC_MemoryDataWidth_16b
- ECC = FMC_ECC_Enable
- ECCPageSize = FMC_ECCPageSize_512Bytes
- TCLRSetupTime = 0
- TARSetupTime = 0

In all timing tables, the T_{HCLK} is the HCLK clock period.

5.3.36 OCTOSPI characteristics

Unless otherwise specified, the parameters given in *Table 146* to *Table 148* are derived from tests performed under the ambient temperature, f_{AHB} frequency and V_{DD} supply voltage conditions summarized in *Table 32*, with the following configuration:

- Output speed set to OSPEEDRy[1:0] = 10, unless otherwise specified
- Delay block enabled for DTR (with DQS)/HyperBus
- Measurement points done at $0.5 \times V_{DD}$ level
- I/O compensation cell activated
- HSLV activated when $V_{DD} \leq 2.7$ V
- Voltage scaling range 1 unless otherwise specified

Refer to *Section 5.3.15: I/O port characteristics* for more details on the input/output alternate function characteristics.

Table 146. OCTOSPI characteristics in SDR mode(1)(2)(3)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{(CLK)}$	OCTOSPI clock frequency	1.71 V ≤ V_{DD} ≤ 3.6 V Voltage range 1 C_L = 15 pF	-	-	93	MHz

5.3.38 SD/SDIO/e•MMC card host interfaces (SDMMC) characteristics

Unless otherwise specified, the parameters given in *Table 152* and *Table 153* are derived from tests performed under the ambient temperature, f_{AHB} frequency and V_{DD} supply voltage conditions summarized in *Table 32*, with the following configuration:

- Output speed set to OSPEEDRy[1:0] = 10
- Capacitive load C_L = 30 pF, unless otherwise specified
- Measurement points done at 0.5 × V_{DD} level
- I/O compensation cell activated
- HSLV activated when $V_{DD} \leq 2.7$ V
- Voltage scaling range 1

Refer to *Section 5.3.15: I/O port characteristics* for more details on the input/output characteristics.

Table 152. SD/*e*•MMC characteristics (V_{DD} = 2.7 V to 3.6 V)(1)(2)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_{PP}	Clock frequency in data transfer mode	-	0	-	100(3)	MHz
$t_{W(CKL)}$	Clock low time	f_{PP} = 52 MHz	8.5	9.5	-	ns
$t_{W(CKH)}$	Clock high time	f_{PP} = 52 MHz	8.5	9.5	-	
CMD, D inputs (referenced to CK) in *e*•MMC legacy/SDR/DDR and SD HS/SDR(4)/DDR(4) modes						
t_{ISU}	Input setup time HS	-	3.5	-	-	ns
t_{IH}	Input hold time HS	-	1.5	-	-	
t_{IDW}(5)	Input valid window (variable window)	-	4.5	-	-	
CMD, D outputs (referenced to CK) in *e*•MMC legacy/SDR/DDR and SD HS/SDR(4)/DDR(4) modes						
t_{OV}	Output valid time HS	-	-	6	7/9.5(6)	ns
t_{OH}	Output hold time HS	-	3	-	-	
CMD, D inputs (referenced to CK) in SD default mode						
t_{ISU}	Input setup time SD	-	3.5	-	-	ns
t_{IH}	Input hold time SD	-	1.5	-	-	
CMD, D outputs (referenced to CK) in SD default mode						
t_{OV}	Output valid default time SD	-	-	1.5	2/4.5(7)	ns
t_{OH}	Output hold default time SD	-	0	-	-	

1. Evaluated by characterization. Not tested in production.
2. In SD/e.MMC DDR mode, the clock OSPEEDRy[1:0] is set to 01 while data OSPEEDRy[1:0] remains at 10.
3. With capacitive load C_L = 20 pF.
4. For SD 1.8 V support, an external voltage converter is needed.
5. Minimum window of time where the data needs to be stable for proper sampling in tuning mode.
6. t_{OV} = 7 ns for SDMMC1 and SDMMC2, t_{OV} = 9.5 ns for SDMMC2 using PB15.
7. t_{OV} = 2 ns for SDMMC1 and SDMMC2, t_{OV} = 4.5 ns for SDMMC2 using PB15.

Downloaded from Arrow.com.

Table 153. *e*•MMC characteristics (V_{DD} = 1.71 V to 1.9 V)(1)(2)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_{PP}	Clock frequency in data transfer mode	-	-	-	84/40(3)	MHz
$t_{W(CKL)}$	Clock low time	f_{PP} = 52 MHz	8.5	9.5	-	ns
$t_{W(CKH)}$	Clock high time	f_{PP} = 52 MHz	8.5	9.5	-	
CMD, D inputs (referenced to CK) in *e*•MMC mode						
t_{ISU}	Input setup time HS	-	3	-	-	ns
t_{IH}	Input hold time HS	-	2	-	-	
t_{IDW}(4)	Input valid window (variable window)	-	4	-	-	
CMD, D outputs (referenced to CK) in *e*•MMC mode						
t_{OV}	Output valid time HS	-	-	6	6.5/16.5(5)	ns
t_{OH}	Output hold time HS	-	4	-	-	

1. Evaluated by characterization. Not tested in production.
2. With capacitive load C_L = 20 pF.
3. For DDR mode on SDMMC2 and using PB15, the maximum frequency is 40 MHz and HSLV must be OFF.
4. Minimum window of time where the data needs to be stable for proper sampling in tuning mode.
5. t_{OV} = 6.5 ns for SDMMC1 and SDMMC2, t_{OV} = 16.5 ns for SDMMC2 using PB15.

5.3.39 Delay block characteristics

Unless otherwise specified, the parameters given in the table below are derived from tests performed under the ambient temperature, f_{HCLK} frequency and V_{DD} supply voltage conditions summarized in *Table 32*.

Table 154. Delay block characteristics(1)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
t_{init}	Initial delay	-	900	1300	2100	ps
t_{Δ}	Unit delay	-	34	41	51	

1. Evaluated by characterization. Not tested in production.

5.3.40 I²C interface characteristics

The I²C interface meets the timings requirements of the I²C-bus specification and user manual rev. 03 for:

- Standard-mode (Sm): with a bitrate up to 100 Kbit/s
- Fast-mode (Fm): with a bitrate up to 400 Kbit/s
- Fast-mode Plus (Fm+): with a bitrate up to 1 Mbit/s

The I2C timings requirements are specified by design, not tested in production, when the I2C peripheral is properly configured (refer to the product reference manual).

The SDA and SCL I/O requirements are met with the following restrictions: the SDA and SCL I/O pins are not “true” open-drain. When configured as open-drain, the PMOS connected between the I/O pin and V_{DDIOx} is disabled, but is still present. Only FT_f I/O pins support Fm+ low-level output-current maximum requirement. Refer to *Section 5.3.15: I/O port characteristics* for the I2C I/Os characteristics.

All I2C SDA and SCL I/Os embed an analog filter. Refer to the table below for the analog filter characteristics.

Downloaded from Arrow.com.

Table 155. I2C analog filter characteristics(1)

Symbol	Parameter	Min	Max	Unit
t_{AF}	Maximum pulse width of spikes that are suppressed by the analog filter	50(2)	152(3)	ns

1. Specified by design. Not tested in production.
2. Spikes with widths below t_{AF} min are filtered.
3. Spikes with width above t_{AF} max are not filtered.

5.3.41 USART (SPI mode) characteristics

Unless otherwise specified, the parameters given in the table below are derived from tests performed under the ambient temperature, f_{PCLKx} frequency and V_{DD} supply voltage conditions summarized in *Table 32*, with the following configuration:

- Output speed set to OSPEEDRy[1:0] = 10
- Capacitive load C_L = 30 pF
- Measurement points done at 0.5 × V_{DD} level
- I/O compensation cell activated
- HSLV activated when $V_{DD} \leq 2.7$ V
- Voltage scaling range 1

Refer to *Section 5.3.15: I/O port characteristics* for more details on the input/output alternate function characteristics (NSS, CK, TX, RX for USART).

Table 156. USART (SPI mode) characteristics(1)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_{CK}	USART clock frequency	SPI master mode, 1.71 V ≤ V_{DD} ≤ 3.6 V	-	-	20	MHz
		SPI slave receiver, 1.71 V ≤ V_{DD} ≤ 3.6 V	-	-	53	
		SPI slave transmitter, 1.71 V ≤ V_{DD} ≤ 3.6 V	-	-	27	
		SPI slave transmitter, 2.7 V ≤ V_{DD} ≤ 3.6 V	-	-	30	

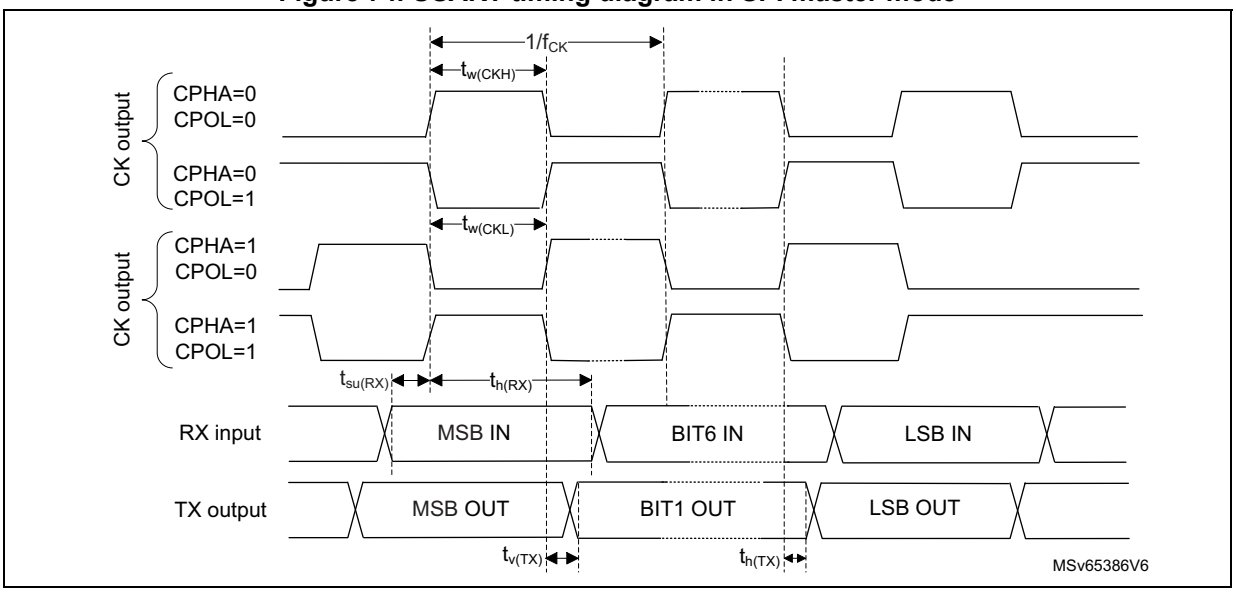
Downloaded from Arrow.com.

Table 156. USART (SPI mode) characteristics(1) (continued)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$t_{su(NSS)}$	NSS setup time	SPI slave mode	T_{ker}(2) + 2	-	-	ns
$t_{h(NSS)}$	NSS hold time	SPI slave mode	2	-	-	
$t_{w(CKH)}$ $t_{w(CKL)}$	CK high and low time	SPI master mode	$1/f_{CK}$ / 2 - 1	$1/f_{CK}$ / 2	$1/f_{CK}$ / 2 + 1	
$t_{su(RX)}$	Data input setup time	SPI master mode	15	-	-	
$t_{su(TX)}$		SPI slave mode	2.5	-	-	
$t_{h(RX)}$	Data input hold time	SPI master mode	4	-	-	
$t_{h(RX)}$		SPI slave mode	1	-	-	
$t_{v(TX)}$	Data output valid time	SPI slave mode, 2.7 V ≤ V_{DD} ≤ 3.6 V	-	13	16.5	
		SPI slave mode, 1.71 V ≤ V_{DD} ≤ 3.6 V	-	13	18.5	
$t_{v(TX)}$		SPI master mode	-	2.5	6.5	
$t_{h(TX)}$	Data output hold time	SPI slave mode	8.5	-	-	
$t_{h(TX)}$		SPI master mode	0.5	-	-	

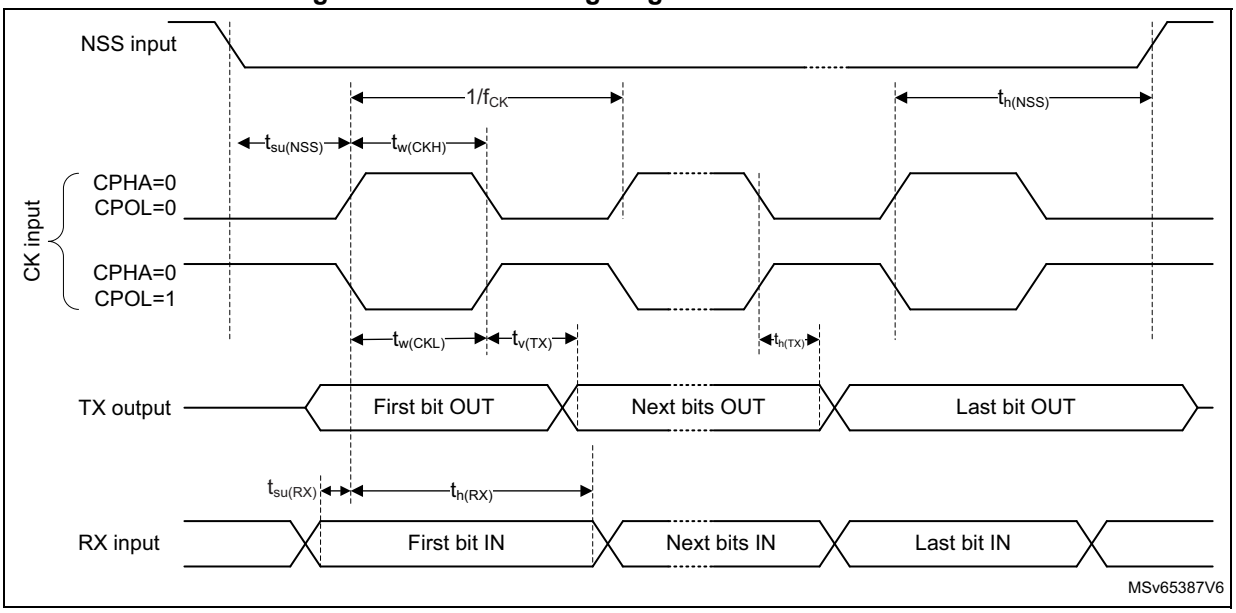
1. Evaluated by characterization. Not tested in production.
2. T_{ker} is the usart_ker_ck_pres clock period.

Figure 74. USART timing diagram in SPI master mode



Downloaded from Arrow.com.

Figure 75. USART timing diagram in SPI slave mode



5.3.42 SPI characteristics

Unless otherwise specified, the parameters given in the table below are derived from tests performed under the ambient temperature, f_{PCLKx} frequency and supply voltage conditions summarized in *Table 32*.

- Output speed set to OSPEEDRy[1:0] = 10
- Capacitive load C_L = 30 pF
- Measurement points done at 0.5 × V_{DD} level
- I/O compensation cell activated
- HSLV activated when V_{DD} ≤ 2.7 V

Refer to *Section 5.3.15: I/O port characteristics* for more details on the input/output alternate function characteristics (NSS, SCK, MOSI, MISO for SPI).

Downloaded from Arrow.com.

Table 157. SPI characteristics(1)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_{SCK} $1/t_{c(SCK)}$	SPI clock frequency	Master mode, 2.7 V ≤ V_{DDIOX} ≤ 3.6 V, voltage range 1	-	-	80	MHz
		Master mode, 1.71 V ≤ V_{DDIOX} < 2.7 V voltage range 1	-	-	75 or 50(2)	
		Master transmitter mode, 2.7 V ≤ V_{DDIOX} ≤ 3.6 V, voltage range 1	-	-	80	
		Master transmitter mode, 1.71 V ≤ V_{DDIOX} ≤ 2.7 V, voltage range 1	-	-	75 or 50(2)	
		Slave receiver mode, 1.71 V ≤ V_{DDIOX} ≤ 3.6 V, voltage range 1	-	-	100	
		Slave mode transmitter/full duplex(3), 1.71 V ≤ V_{DDIOX} < 2.7 V, voltage range 1	-	-	37 or 25(4)	
		Slave mode transmitter/full duplex(3), 2.7 V ≤ V_{DDIOX} ≤ 3.6 V, voltage range 1	-	-	35.5	
		Master or slave mode, 1.71 V ≤ V_{DDIOX} ≤ 3.6 V, voltage range 4	-	-	12.5	
		Master or slave mode, 1.08 V ≤ V_{DDIO2} ≤ 1.32 V(5)	-	-	15	
$t_{su(NSS)}$	NSS setup time	Slave mode	4	-	-	ns
$t_{h(NSS)}$	NSS hold time	Slave mode	3	-	-	
$t_{w(SCKH)}$ $t_{w(SCKL)}$	SCK high and low time	Master mode	t_{SCK}(6)/2 - 1	t_{SCK}/2	t_{SCK}/2 + 1	
$t_{su(MI)}$	Data input setup time	Master mode	4.5	-	-	
$t_{su(SI)}$		Slave mode	2.5	-	-	
$t_{h(MI)}$	Data input hold time	Master mode	3	-	-	
$t_{h(SI)}$		Slave mode	1	-	-	
$t_{a(SO)}$	Data output access time	Slave mode	9	12	34	

Downloaded from Arrow.com.

Table 157. SPI characteristics(1) (continued)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$t_{dis(SO)}$	Data output disable time	Slave mode	9	10	16	ns
$t_{v(SO)}$	Data output valid time	Slave mode, 2.7 V ≤ V_{DDIOX} ≤ 3.6 V, voltage range 1	-	11.5	14	
		Slave mode, 1.71 V ≤ V_{DDIOX} < 2.7 V, voltage range 1	-	11.5	13.5 or 20(4)	
		Slave mode, 1.71 V ≤ V_{DDIOX} ≤ 3.6 V, voltage range 4	-	17	19.5 or 27(4)	
		Slave mode, 1.08 V ≤ V_{DDIO2} ≤ 1.32 V(5)	-	23	25	
$t_{v(MO)}$	Data output valid time	Master mode	-	2.5	3 or 9.5(7) or 12.5(8)	
$t_{h(SO)}$	Data output hold time	Slave mode, 1.71 V ≤ V_{DDIOX} ≤ 3.6 V	7	-	-	
		Slave mode, 1.08 V ≤ V_{DDIO2} ≤ 1.32 V(5)	15	-	-	
$t_{h(MO)}$		Master mode	0.5	-	-	

1. Evaluated by characterization. Not tested in production.
2. When using PA5, PA9, PC10, PB3, PB13.
3. The maximum frequency in slave transmitter mode is determined by the sum of $t_{v(SO)}$ and $t_{su(MI)}$ that has to fit into SCK low or high phase preceding the SCK sampling edge. This value can be achieved when the SPI communicates with a master having $t_{su(MI)}$ = 0 while Duty(SCK) = 50%.
4. When using PA11, PB4, PB14.
5. The SPI is mapped on port G I/Os, that is supplied by VDDIO2 specified down to 1.08V. The SPI is tested at this value.
6. t_{SCK} = tspi_ker_ck × baudrate prescaler.
7. When using PA12.
8. When using PB15.

5.3.43 SAI characteristics

Unless otherwise specified, the parameters given in the table below are derived from tests performed under the ambient temperature, f_{PCLKx} frequency and V_{DD} supply voltage conditions summarized in *Table 32*, with the following configuration:

- Output speed set to OSPEEDRy[1:0] = 10
- Capacitive load C_L = 30 pF
- Measurement points done at 0.5 × V_{DD} level
- I/O compensation cell activated
- HSLV activated when V_{DD} ≤ 2.7 V
- Voltage scaling range 1

Refer to *Section 5.3.15: I/O port characteristics* for more details on the input/output alternate function characteristics (SCK, SD, FS).

Downloaded from Arrow.com.

Table 158. SAI characteristics(1)

Symbol	Parameter	Conditions	Min	Max	Unit
f_{MCK}	SAI main clock output	-	-	50	MHz
f_{SCK}	SAI clock frequency(2)	Master transmitter, 2.7 V ≤ V_{DDIOX} ≤ 3.6 V	-	26	
		Master transmitter, 1.71 V ≤ V_{DDIOX} ≤ 3.6 V	-	18	
		Master receiver, 1.71 V ≤ V_{DDIOX} ≤ 3.6 V	-	21.5	
		Slave transmitter, 2.7 V ≤ V_{DDIOX} ≤ 3.6 V	-	27.5	
		Slave transmitter, 1.71 V ≤ V_{DDIOX} ≤ 3.6 V	-	18	
		Slave receiver, 1.71 V ≤ V_{DDIOX} ≤ 3.6 V	-	50	
$t_{v(FS)}$	FS valid time	Master mode, 2.7 V ≤ V_{DDIOX} ≤ 3.6 V	-	16	ns
		Master mode 1.71 V ≤ V_{DDIOX} ≤ 3.6 V	-	23	
$t_{h(FS)}$	FS hold time	Master mode	7	-	
$t_{su(FS)}$	FS setup time	Slave mode	2.5	-	
$t_{h(FS)}$	FS hold time	Slave mode	1	-	
$t_{su(SD_A_MR)}$	Data input setup time	Master receiver	4	-	
$t_{su(SD_B_SR)}$		Slave receiver	3	-	
$t_{h(SD_A_MR)}$	Data input hold time	Master receiver	2	-	
$t_{h(SD_B_SR)}$		Slave receiver	1	-	
$t_{v(SD_B_ST)}$	Data output valid time	Slave transmitter (after enable edge), 2.7 V ≤ V_{DDIOX} ≤ 3.6 V	-	18	
		Slave transmitter (after enable edge), 1.71 V ≤ V_{DDIOX} ≤ 3.6 V	-	27.5	
$t_{h(SD_B_ST)}$	Data output hold time	Slave transmitter (after enable edge)	8	-	
$t_{v(SD_A_MT)}$	Data output valid time	Master transmitter (after enable edge), 2.7 V ≤ V_{DDIOX} ≤ 3.6 V	-	19	
		Master transmitter (after enable edge), 1.71 V ≤ V_{DDIOX} ≤ 3.6 V	-	27.5	
$t_{h(SD_A_MT)}$	Data output hold time	Master transmitter (after enable edge)	8	-	

1. Evaluated by characterization. Not tested in production.
2. APB clock frequency that must be at least twice SAI clock frequency.

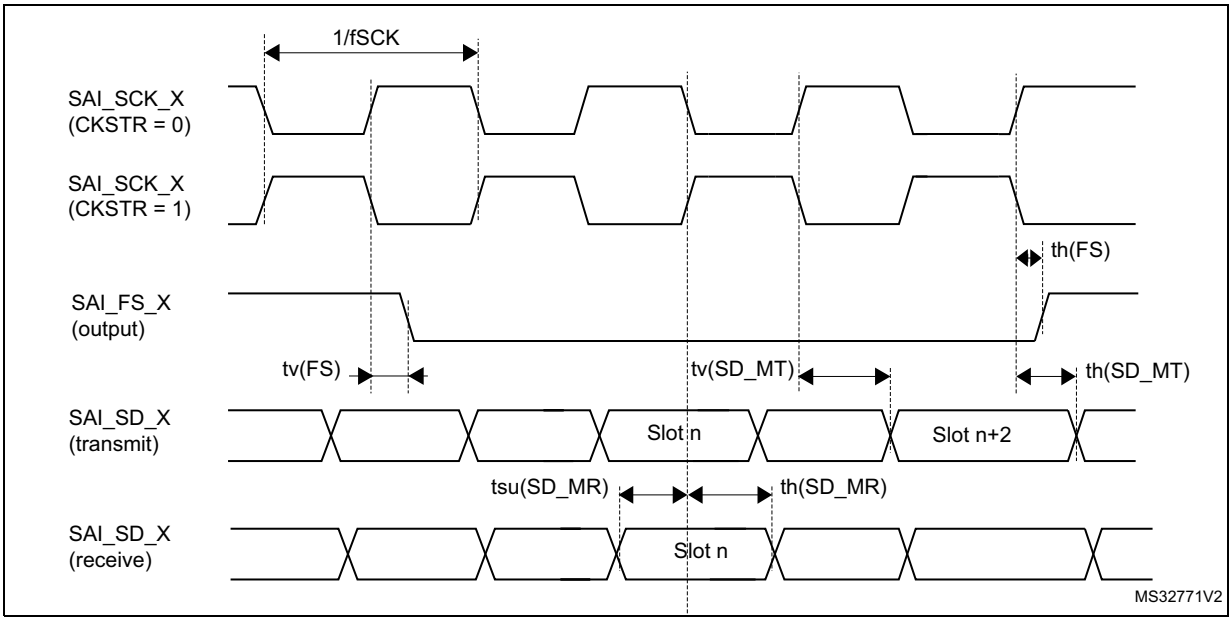

Figure 80. SAI slave timing diagram

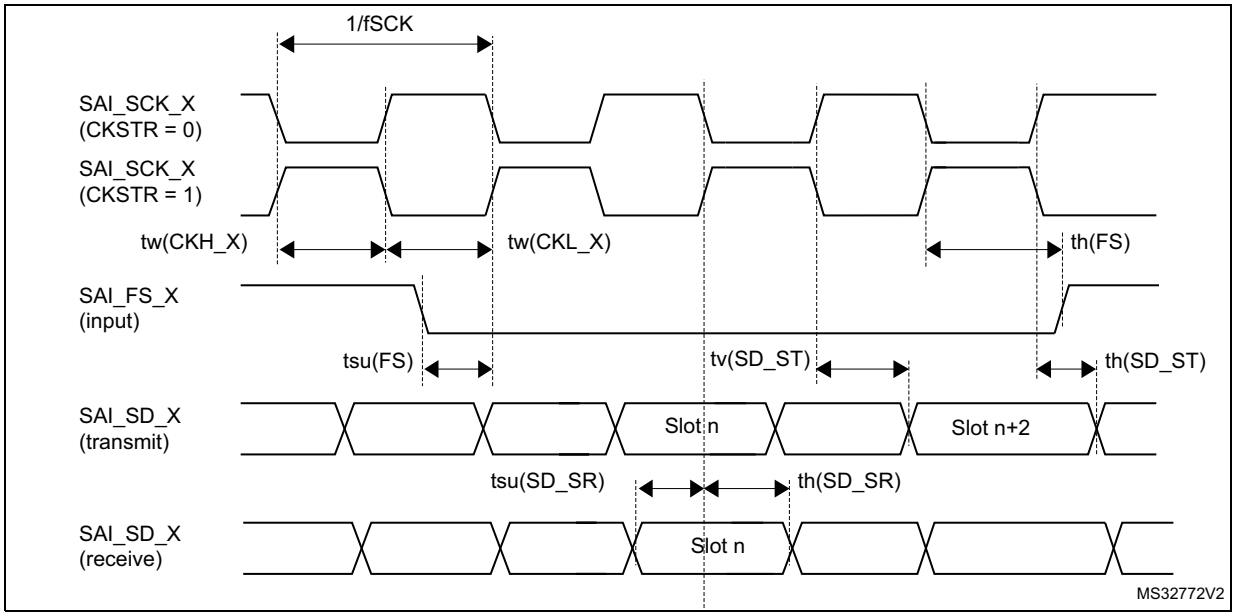

5.3.44 OTG_HS characteristics

The OTG_HS controller complies with the following specifications:

- USB On-The-Go supplement, revision 2.0
- Universal Serial Bus revision 2.0 specification
- Battery charging specification, revision 1.2

Downloaded from Arrow.com.

The parameters given in tables below are derived from tests performed under temperature and V_{DD} supply voltage conditions summarized in *Table 32: General operating conditions*.

Table 159. OTG_HS electrical characteristics(1)

Symbol	Parameter	Condition	Min	Typ	Max	Unit
V_{DDUSB}	USB transceiver operating voltage	-	3.12(2)	-	3.6	V
f_{HCLK}	f_{HCLK} value to guarantee proper operation of the OTG_HS interface	-	30(3)	-	-	MHz
R_{PUI}	Embedded USB_DP pull-up value during idle	-	900	1250	1575	Ω
R_{PUR}	Embedded USB_DP pull-up value during reception	-	1425(3)	2250	3090(3)	
R_{PD}	Embedded USB_DP and USB_DM pull-down value	-	14250	-	24800	
Z_{DRV}	Output driver impedance(4)	Driving high or low	40.5(3)	45	49.5(3)	
t_{lr}	Rise time	CL < 5 pF	0.5(3)	-	-	ns
t_{lf}	Fall time	CL < 5 pF	0.5(3)	-	-	
t_{lrfm}	Rise/fall time matching	-	80(3)	-	125(3)	%

1. Evaluated by characterization. Not tested in production, unless otherwise specified.
2. The USB functionality is ensured down to 3 V but not the full USB electrical characteristics which are degraded in 3.0 to 3.12 V voltage range.
3. Specified by design. Not tested in production.
4. No external termination series resistors are required on USB_DP (D+) and USB_DM (D-). The matching impedance is already included in the embedded driver.

Table 160. OTG_HS DC electrical characteristics(1)

Symbol	Parameter	Condition	Min	Typ	Max	Unit
V_{hssq}	High-speed squelch detection threshold	-	100(2)	-	150	mV
V_{hsdsc}	High-speed disconnect detection threshold	-	525	-	625	
V_{hsdif}	High-speed differential detection threshold	-	100	-	-	
V_{hscm}	High-speed data signaling common mode voltage range	-	-50	-	500	
V_{hsoi}	High-speed idle level	-	-10	-	10	
V_{hsoh}	High-speed data signaling high	-	360	-	440	
V_{hsol}	High-speed data signaling low	-	-10	-	10	
$V_{hchirpj}$	Chirp J level	-	700	-	1100	
$V_{hchirpk}$	Chirp K level	-	-900	-	-500	

1. Evaluated by characterization. Not tested in production.
2. 50 mV test waivers from usb.org have been applied.

Downloaded from Arrow.com.

Table 161. OTG_HS PHY BCD electrical characteristics(1)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$I_{DD(USBBCD)}$	Primary detection mode consumption on V_{DDUSB}	-	-	4.9	5.7	mA
	Secondary detection mode consumption on V_{DDUSB}	-	-	4.8		
$I_{DD11(USBBCD)}$	Primary detection mode consumption on $V_{DD11USB}$	-	-	5.2	7.4	
	Secondary detection mode consumption on $V_{DD11USB}$	-	-	5.3		
R_{DAT_LKG}	Data line leakage resistance	-	300(2)	-	-	kΩ
V_{DAT_LKG}	Data line leakage voltage	-	0.0	-	3.6(2)	V
R_{DCP_DAT}	Dedicated charging port resistance across D+/D-	-	-	-	200(2)	Ω
V_{LGC_HI}	Logic high	-	2.0	-	3.6	V
V_{LGC_LOW}	Logic low	-	-	-	0.8	
V_{LGC}	Logic threshold	-	0.8	-	2.0	
V_{DAT_REF}	Data detect voltage	-	0.25(2)	-	0.4(2)	
V_{DP_SRC}	D+ source voltage	-	0.5	-	0.7	
V_{DM_SRC}	D- source voltage	-	0.5	-	0.7	
I_{DM_SINK}	D- sink current	-	25	-	175	µA
I_{DP_SINK}	D+ sink current	-	25	-	175	
I_{DP_SRC}	Data contact detect current source	-	7.0	-	13	

1. Evaluated by characterization. Not tested in production, unless otherwise specified.
2. Specified by design. Not tested in production.

5.3.45 UCPD characteristics

UCPD controller complies with USB Type-C Rev 1.2 and USB Power Delivery Rev 3.0 specifications.

Table 162. UCPD characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{DD}	UCPD operating supply voltage	Sink mode only	3.0	3.3	3.6	V
		Sink and source mode	3.135	3.3	3.465	

5.3.46 JTAG/SWD interface characteristics

Unless otherwise specified, the parameters given in the tables below are derived from tests performed under the ambient temperature, f_{HCLKx} frequency and V_{DD} supply voltage conditions summarized in *Table 32*, with the following configuration:

- Output speed set to OSPEEDRy[1:0] = 10
- Capacitive load C_L = 30 pF
- Measurement points done at 0.5 × V_{DD} level

Downloaded from Arrow.com.

Refer to *Section 5.3.15: I/O port characteristics* for more details on the input/output characteristics.

Table 163. JTAG characteristics(1)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
F_{TCK}	TCK clock frequency	2.7 V ≤ V_{DD} ≤ 3.6 V	-	-	27.5	MHz
		1.71 V ≤ V_{DD} ≤ 3.6 V	-	-	20.5	
$ti_{su(TMS)}$	TMS input setup time	-	2	-	-	ns
$ti_{h(TMS)}$	TMS input hold time	-	3	-	-	
$ti_{su(TDI)}$	TDI input setup time	-	3	-	-	
$ti_{h(TDI)}$	TDI input hold time	-	1	-	-	
$t_{ov(TDO)}$	TDO output valid time	2.7 V ≤ V_{DD} ≤ 3.6 V	-	14	18	
		1.71 V ≤ V_{DD} ≤ 3.6 V	-	14	24	
$t_{oh(TDO)}$	TDO output hold time	-	10	-	-	

1. Evaluated by characterization. Not tested in production.

Table 164. SWD characteristics(1)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
F_{SWCLK}	SWCLK clock frequency	2.7 V ≤ V_{DD} ≤ 3.6 V	-	-	60.5	MHz
		1.71 V ≤ V_{DD} ≤ 3.6 V	-	-	43	
$ti_{su(SWDIO)}$	SWDIO input setup time	-	1	-	-	ns
$ti_{h(SWDIO)}$	SWDIO input hold time	-	2.5	-	-	
$t_{ov(SWDIO)}$	SWDIO output valid time	2.7 V ≤ V_{DD} ≤ 3.6 V	-	10.5	16.5	
		1.71 V ≤ V_{DD} ≤ 3.6 V	-	10.5	23	
$t_{oh(SWDIO)}$	SWDIO output hold time	-	7.5	-	-	

1. Evaluated by characterization. Not tested in production.

6 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK packages, depending on their level of environmental compliance. ECOPACK specifications, grade definitions and product status are available at: *www.st.com*. ECOPACK is an ST trademark.

6.1 Device marking

Refer to technical note "Reference device marking schematics for STM32 microcontrollers and microprocessors" (TN1433) available on *www.st.com*, for the location of pin 1 / ball A1 as well as the location and orientation of the marking areas versus pin 1 / ball A1.

Parts marked as "ES", "E" or accompanied by an engineering sample notification letter, are not yet qualified and therefore not approved for use in production. ST is not responsible for any consequences resulting from such use.

In no event will ST be liable for the customer using any of these engineering samples in production. ST's Quality department must be contacted prior to any decision to use these engineering samples to run a qualification activity.

A WLCSP simplified marking example (if any) is provided in the corresponding package information subsection.

Downloaded from Arrow.com.

6.2 LQFP100 package information (1L)

This LQFP is 100 lead, 14 x 14 mm low-profile quad flat package.

Note: See list of notes in the notes section.

Notes:

1. Dimensioning and tolerancing schemes conform to ASME Y14.5M-1994.
2. The Top package body size may be smaller than the bottom package size by as much as 0.15 mm.
3. Datums A-B and D to be determined at datum plane H.
4. To be determined at seating datum plane C.
5. Dimensions D1 and E1 do not include mold flash or protrusions. Allowable mold flash or protrusions is “0.25 mm” per side. D1 and E1 are Maximum plastic body size dimensions including mold mismatch.
6. Details of pin 1 identifier are optional but must be located within the zone indicated.
7. All Dimensions are in millimeters.
8. No intrusion allowed inwards the leads.
9. Dimension “b” does not include dambar protrusion. Allowable dambar protrusion shall not cause the lead width to exceed the maximum “b” dimension by more than 0.08 mm. Dambar cannot be located on the lower radius or the foot. Minimum space between protrusion and an adjacent lead is 0.07 mm for 0.4 mm and 0.5 mm pitch packages.
10. Exact shape of each corner is optional.
11. These dimensions apply to the flat section of the lead between 0.10 mm and 0.25 mm from the lead tip.
12. A1 is defined as the distance from the seating plane to the lowest point on the package body.
13. “N” is the number of terminal positions for the specified body size.
14. Values in inches are converted from mm and rounded to 4 decimal digits.
15. Drawing is not to scale.

Notes:

1. Dimensioning and tolerancing schemes conform to ASME Y14.5M-1994.
2. The Top package body size may be smaller than the bottom package size by as much as 0.15 mm.
3. Datums A-B and D to be determined at datum plane H.
4. To be determined at seating datum plane C.
5. Dimensions D1 and E1 do not include mold flash or protrusions. Allowable mold flash or protrusions is “0.25 mm” per side. D1 and E1 are Maximum plastic body size dimensions including mold mismatch.
6. Details of pin 1 identifier are optional but must be located within the zone indicated.
7. All Dimensions are in millimeters.
8. No intrusion allowed inwards the leads.
9. Dimension “b” does not include dambar protrusion. Allowable dambar protrusion shall not cause the lead width to exceed the maximum “b” dimension by more than 0.08 mm. Dambar cannot be located on the lower radius or the foot. Minimum space between protrusion and an adjacent lead is 0.07 mm for 0.4 mm and 0.5 mm pitch packages.
10. Exact shape of each corner is optional.
11. These dimensions apply to the flat section of the lead between 0.10 mm and 0.25 mm from the lead tip.
12. A1 is defined as the distance from the seating plane to the lowest point on the package body.

fff	0.08			0.0031		

Notes:

1. Dimensioning and tolerancing schemes conform to ASME Y14.5M-2009 apart European projection.
2. UFBGA stands for ulta profile fine pitch ball grid array: 0.50 mm < A ≤ 0.65 mm / fine pitch e < 1.00 mm.
3. The profile height, A, is the distance from the seating plane to the highest point on the package. It is measured perpendicular to the seating plane.
4. A1 is defined as the distance from the seating plane to the lowest point on the package body.
5. Dimension b is measured at the maximum diameter of the terminal (ball) in a plane parallel to primary datum C.
6. BSC stands for BASIC dimensions. It corresponds to the nominal value and has no tolerance. For tolerances refer to form and position table. On the drawing these dimensions are framed.
7. Primary datum C is defined by the plane established by the contact points of three or more solder balls that support the device when it is placed on top of a planar surface.
8. The terminal (ball) A1 corner must be identified on the top surface of the package by using a corner chamfer, ink or metalized markings, or other feature of package body or

Downloaded from Arrow.com.

integral heat slug. A distinguish feature is allowable on the bottom surface of the package to identify the terminal A1 corner. Exact shape of each corner is optional.

9. e represents the solder ball grid pitch.
10. N represents the total number of balls on the BGA.
11. Basic dimensions SD and SE are defined with respect to datums A and B. It defines the position of the centre ball(s) in the outer row or column of a fully populated matrix.
12. Values in inches are converted from mm and rounded to 4 decimal digits.
13. Drawing is not to scale.

Figure 88. UFBGA144 - Footprint example

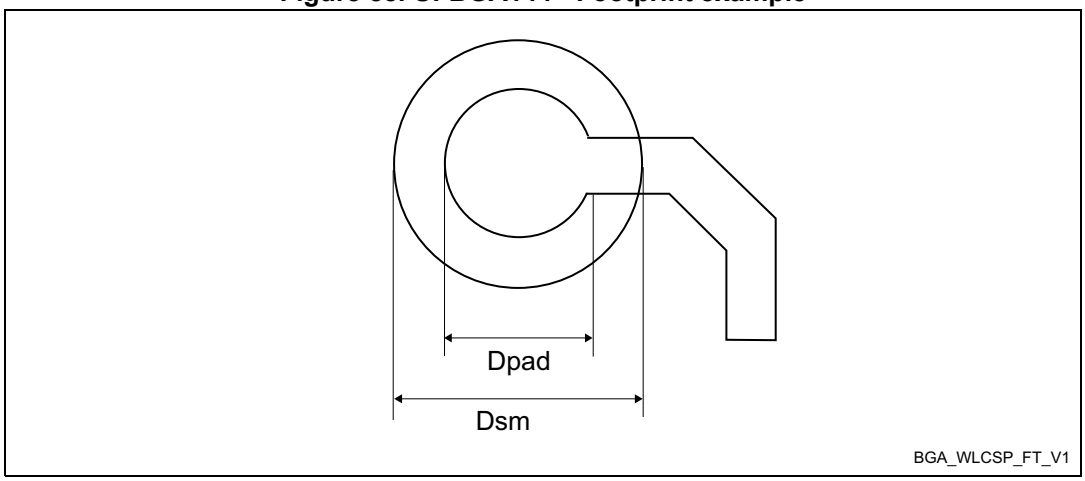

Table 168. UFBGA144 - Example of PCB design rules (0.80 mm pitch BGA)

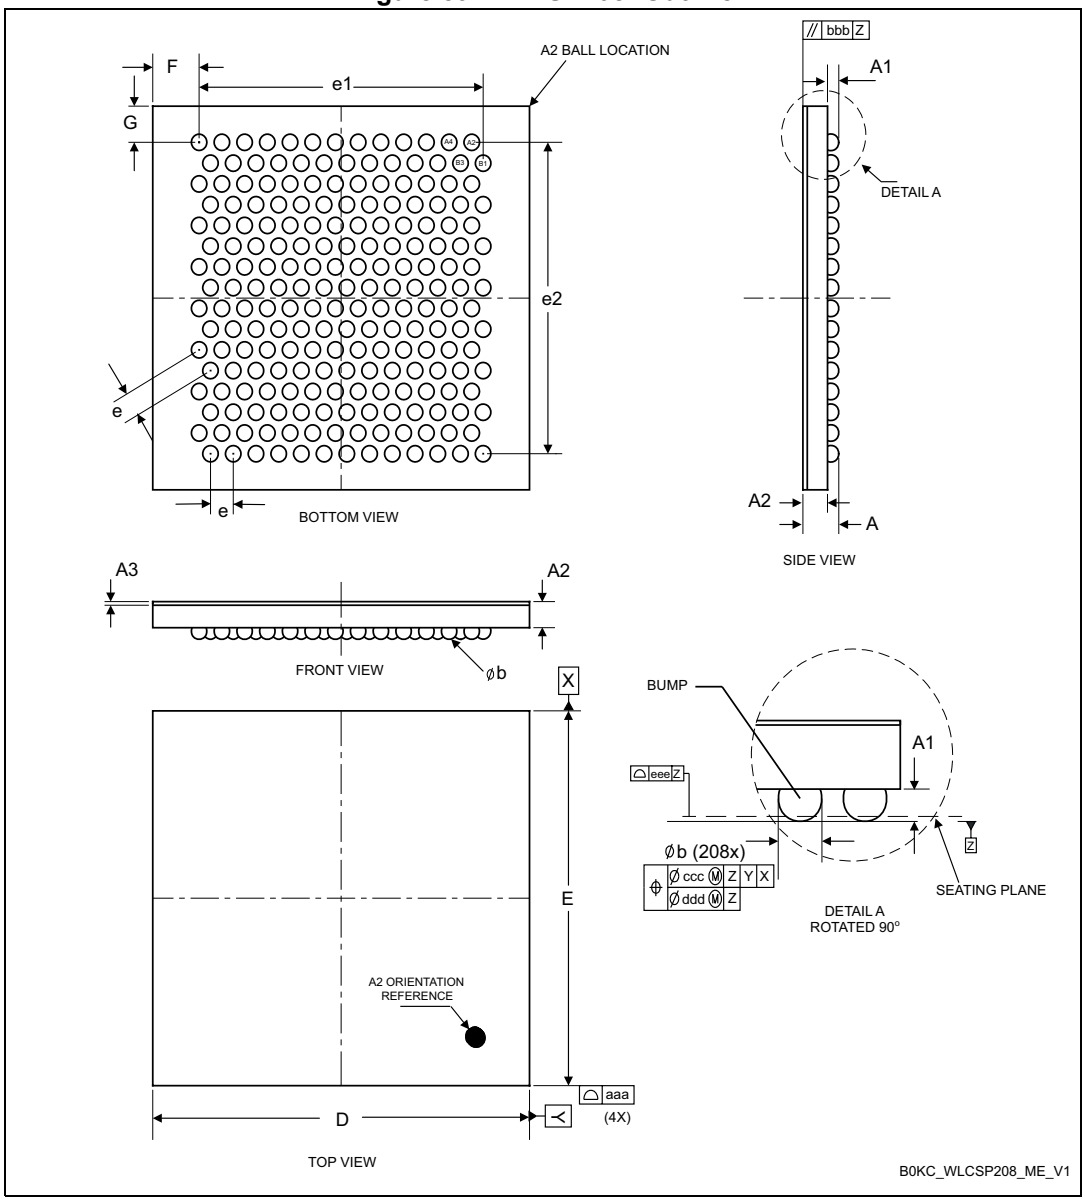
Dimension	Values
Pitch	0.80 mm
Dpad	0.400 mm
Dsm	0.550 mm typ. (depends on the soldermask registration tolerance)
Stencil opening	0.400 mm
Stencil thickness	Between 0.100 mm and 0.125 mm
Pad trace width	0.120 mm

Downloaded from Arrow.com.

6.5 WLCSP208 package information (B0KC)

This WLCSP is a 208-ball, 5.8 x 5.6 mm, 0.35 mm pitch, wafer level chip scale array package.

Figure 89. WLCSP208- Outline



1. Drawing is not to scale.
2. Dimension is measured at the maximum bump diameter parallel to primary datum Z.
3. Primary datum Z and seating plane are defined by the spherical crowns of the bump.
4. Bump position designation per JESD 95-1, SPP-010. The tolerance of position that controls the location of the pattern of balls with respect to datums X and Y. For each ball there is a cylindrical tolerance zone ccc perpendicular to datum Z and located on true position with respect to datums X and Y as defined by e. The axis perpendicular to datum Z of each ball must lie within this tolerance zone.

Downloaded from Arrow.com.

ddd[8]	-	-	0.05	-	-	0.0020
eee	-	-	0.05	-	-	0.0020

1. Values in inches are converted from mm and rounded to 4 decimal digits.
2. The maximum total package height is calculated by the RSS method (root sum square) using nominal and tolerances values of A1 and A2.
3. Back side coating. The nominal dimension is rounded to the third decimal place resulting from process capability.
4. Dimension is measured at the maximum bump diameter parallel to primary datum Z.
5. Calculated dimensions are rounded to the third decimal place.
6. N is the total number of terminals.
7. Bump position designation per JESD 95-1, SPP-010. The tolerance of position that controls the location of the pattern of balls with respect to datums X and Y. For each ball, there is a cylindrical tolerance zone ccc perpendicular to datum Z and located on true position with respect to datums X and Y as defined by e. The axis perpendicular to datum Z of each ball must lie within this tolerance zone.
8. The tolerance of position that controls the location of the balls within the matrix with respect to each other. For each ball there is a cylindrical tolerance zone ddd perpendicular to datum Z and located on true position as defined by e. The axis perpendicular to datum Z of each ball must lie within this tolerance zone. Each tolerance zone ddd in the array is contained entirely in the respective zone ccc above. The axis of each ball must lie simultaneously in both tolerance zones.

Dpad	0.400 mm
Dsm	0.470 mm typ. (depends on the soldermask registration tolerance)
Stencil opening	0.400 mm
Stencil thickness	Between 0.100 mm and 0.125 mm
Pad trace width	0.120 mm

6.7 Package thermal characteristics

The maximum chip-junction temperature, T_J max, in degrees Celsius, can be calculated using the following equation:

T_J max = T_A max + (P_D max * Θ_{JA})

where:

- T_A max is the maximum ambient temperature in °C.
- Θ_{JA} is the package junction-to-ambient thermal resistance in °C/W.
- P_D max is the sum of P_{INT} max and $P_{I/O}$ max (P_D max = P_{INT} max + $P_{I/O}$ max).
- P_{INT} max is the product of I_{DD} and V_{DD}, expressed in Watts. This is the maximum chip internal power.

$P_{I/O}$ max represents the maximum power dissipation on output pins:

$P_{I/O}$ max = $\sum(V_{OL} * I_{OL}) + \sum((V_{DDIOx} - V_{OH}) * I_{OH})$

taking into account the actual V_{OL}/I_{OL} and V_{OH}/I_{OH} of the I/Os at low and high level in the application.

Downloaded from Arrow.com.

Table 173. Package thermal characteristics

Symbol	Parameter	Package	Value	Unit
Θ_{JA}	Thermal resistance junction-ambient	LQFP100 14 x 14 mm	31.7	°C/W
		UFBGA144 10 x 10 mm	26.5	
		LQFP144 20 x 20 mm	33.3	
		WLCSP208 5.8 x 5.6 mm	31.1	
		TFBGA216 3 x 13 mm	25.5	
Θ_{JB}	Thermal resistance junction-board	LQFP100 14 x 14 mm	17.6

7 Ordering information

Example: STM32 U 5F9 B J Y 6 Q TR

Device family

STM32 = Arm® based 32-bit microcontroller

Product type

U = ultra-low-power

Device subfamily

5F9 = STM32U5F9xx with USB HS and DSI

5F7 = STM32U5F7xx with USB HS

Pin/ball count

V = 100
Z = 144
B = 208
N= 216

Flash memory size

J = 4 Mbytes
I = 2 Mbytes

Package

J = UFBGA (10 x 10 mm)
T = LQFP
H = TFBGA (13 x 13 mm)
Y = WLCSP

Temperature range

6 = Industrial temperature range, -40 to 85 °C (105 °C junction)

Dedicated pinout

Q = Dedicated pinout supporting SMPS step-down converter

Packing

TR = tape and reel

xxx = programmed parts

For a list of available options (such as speed or package) or for further information on any aspect of this device, contact the nearest ST sales office.

8 Important security notice

The STMicroelectronics group of companies (ST) places a high value on product security, which is why the ST product(s) identified in this documentation may be certified by various security certification bodies and/or may implement our own security measures as set forth herein. However, no level of security certification and/or built-in security measures can guarantee that ST products are resistant to all forms of attacks. As such, it is the responsibility of each of ST's customers to determine if the level of security provided in an ST product meets the customer needs both in relation to the ST product alone, as well as when combined with other components and/or software for the customer end product or application. In particular, take note that:

- ST products may have been certified by one or more security certification bodies, such as Platform Security Architecture (www.psacertified.org) and/or Security Evaluation standard for IoT Platforms (www.trustcb.com). For details concerning whether the ST product(s) referenced herein have received security certification along with the level and current status of such certification, either visit the relevant certification standards website or go to the relevant product page on www.st.com for the most up to date information. As the status and/or level of security certification for an ST product can change from time to time, customers should re-check security certification status/level as needed. If an ST product is not shown to be certified under a particular security standard, customers should not assume it is certified.
- Certification bodies have the right to evaluate, grant and revoke security certification in relation to ST products. These certification bodies are therefore independently responsible for granting or revoking security certification for an ST product, and ST does not take any responsibility for mistakes, evaluations, assessments, testing, or other activity carried out by the certification body with respect to any ST product.
- Industry-based cryptographic algorithms (such as AES, DES, or MD5) and other open standard technologies which may be used in conjunction with an ST product are based on standards which were not developed by ST. ST does not take responsibility for any flaws in such cryptographic algorithms or open technologies or for any methods which have been or may be developed to bypass, decrypt or crack such algorithms or technologies.
- While robust security testing may be done, no level of certification can absolutely guarantee protections against all attacks, including, for example, against advanced attacks which have not been tested for, against new or unidentified forms of attack, or against any form of attack when using an ST product outside of its specification or intended use, or in conjunction with other components or software which are used by customer to create their end product or application. ST is not responsible for resistance against such attacks. As such, regardless of the incorporated security features and/or any information or support that may be provided by ST, each customer is solely responsible for determining if the level of attacks tested for meets their needs, both in relation to the ST product alone and when incorporated into a customer end product or application.
- All security features of ST products (inclusive of any hardware, software, documentation, and the like), including but not limited to any enhanced security features added by ST, are provided on an "AS IS" BASIS. AS SUCH, TO THE EXTENT PERMITTED BY APPLICABLE LAW, ST DISCLAIMS ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, unless the applicable written and signed contract terms specifically provide otherwise.
