

## 8-Mbit (512K × 16) Static RAM

### Features

- Very high speed: 45 ns
- Wide voltage range: 2.2 V to 3.6 V and 4.5 V to 5.5 V
- Ultra low standby power
  - Typical Standby current: 2  $\mu$ A
  - Maximum Standby current: 8  $\mu$ A
- Ultra low active power
  - Typical active current: 1.8 mA at f = 1 MHz
- Easy memory expansion with  $\overline{\text{CE}}$  and  $\overline{\text{OE}}$  features
- Automatic power down when deselected
- Complementary metal oxide semiconductor (CMOS) for optimum speed and power
- Available in Pb-free 44-pin thin small outline package (TSOP) II package

### Functional Description

The CY62157ESL is a high performance CMOS static RAM organized as 512K words by 16 bits. This device features advanced circuit design to provide ultra low active current. This is ideal for providing More Battery Life™ (MoBL®) in portable applications. The device also has an automatic power down feature that significantly reduces power consumption when

addresses are not toggling. Place the device into standby mode when deselected ( $\overline{\text{CE}}$  HIGH or both  $\overline{\text{BHE}}$  and  $\overline{\text{BLE}}$  are HIGH). The input or output pins ( $\text{I/O}_0$  through  $\text{I/O}_{15}$ ) are placed in a high impedance state when the device is deselected ( $\overline{\text{CE}}$  HIGH), the outputs are disabled ( $\overline{\text{OE}}$  HIGH), both the Byte High Enable and the Byte Low Enable are disabled ( $\overline{\text{BHE}}$ ,  $\overline{\text{BLE}}$  HIGH), or during an active write operation ( $\overline{\text{CE}}$  LOW and  $\overline{\text{WE}}$  LOW).

To write to the device, take Chip Enable ( $\overline{\text{CE}}$ ) and Write Enable ( $\overline{\text{WE}}$ ) inputs LOW. If Byte Low Enable ( $\overline{\text{BLE}}$ ) is LOW, then data from I/O pins ( $\text{I/O}_0$  through  $\text{I/O}_7$ ) is written into the location specified on the address pins ( $\text{A}_0$  through  $\text{A}_{18}$ ). If Byte High Enable ( $\overline{\text{BHE}}$ ) is LOW, then data from I/O pins ( $\text{I/O}_8$  through  $\text{I/O}_{15}$ ) is written into the location specified on the address pins ( $\text{A}_0$  through  $\text{A}_{18}$ ).

To read from the device, take Chip Enable ( $\overline{\text{CE}}$ ) and Output Enable ( $\overline{\text{OE}}$ ) LOW while forcing the Write Enable ( $\overline{\text{WE}}$ ) HIGH. If Byte Low Enable ( $\overline{\text{BLE}}$ ) is LOW, then data from the memory location specified by the address pins appear on  $\text{I/O}_0$  to  $\text{I/O}_7$ . If Byte High Enable ( $\overline{\text{BHE}}$ ) is LOW, then data from memory appears on  $\text{I/O}_8$  to  $\text{I/O}_{15}$ . See the [Truth Table on page 11](#) for a complete description of read and write modes.

The CY62157ESL device is suitable for interfacing with processors that have TTL I/P levels. It is not suitable for processors that require CMOS I/P levels. Please see [Electrical Characteristics on page 4](#) for more details and suggested alternatives.

### Notes

1. Datasheet specifications are not guaranteed for V<sub>CC</sub> in the range of 3.6 V to 4.5 V.
2. Typical values are included for reference only and are not guaranteed or tested. Typical values are measured at V<sub>CC</sub> = 3 V, and V<sub>CC</sub> = 5 V, T<sub>A</sub> = 25 °C.

## Maximum Ratings

Exceeding the maximum ratings may impair the useful life of the device. These user guidelines are not tested.

Storage Temperature ..... -65 °C to +150 °C

Ambient Temperature with  
Power Applied ..... -55 °C to +125 °C

Supply Voltage to Ground Potential ..... -0.5 V to 6.0 V

DC Voltage Applied to Outputs  
in High Z State <sup>[3, 4]</sup> ..... -0.5 V to 6.0 V

DC Input Voltage <sup>[3, 4]</sup> ..... -0.5 V to 6.0 V

Output Current into Outputs (LOW) ..... 20 mA

Static Discharge Voltage  
(MIL-STD-883, Method 3015) ..... >2001 V

Latch up Current ..... >200 mA

## Operating Range

| Device     | Range      | Ambient Temperature | V <sub>CC</sub> <sup>[5]</sup>     |
|------------|------------|---------------------|------------------------------------|
| CY62157ESL | Industrial | -40 °C to +85 °C    | 2.2 V–3.6 V,<br>and<br>4.5 V–5.5 V |

### Notes

- V<sub>IL</sub> (min) = -2.0 V for pulse durations less than 20 ns.
- V<sub>IH</sub> (max) = V<sub>CC</sub> + 0.75 V for pulse durations less than 20 ns.
- Full device AC operation assumes a 100 μs ramp time from 0 to V<sub>CC</sub> (min) and 200 μs wait time after V<sub>CC</sub> stabilization.
- Typical values are included for reference only and are not guaranteed or tested. Typical values are measured at V<sub>CC</sub> = 3 V, and V<sub>CC</sub> = 5 V, T<sub>A</sub> = 25 °C.
- Please note that the maximum V<sub>OH</sub> limit does not exceed minimum CMOS V<sub>IH</sub> of 3.5 V. If you are interfacing this SRAM with 5 V legacy processors that require a minimum V<sub>IH</sub> of 3.5 V, please refer to Application Note [AN6081](#) for technical details and options you may consider.
- Chip enable (CE) needs to be tied to CMOS levels to meet the I<sub>SB1</sub>/I<sub>SB2</sub> / I<sub>CCDR</sub> spec. Other inputs can be left floating.

## Capacitance

## Data Retention Waveform

Figure 3. Data Retention Waveform

### Notes

10. Typical values are included for reference only and are not guaranteed or tested. Typical values are measured at  $V_{CC} = 3 \text{ V}$ , and  $V_{CC} = 5 \text{ V}$ ,  $T_A = 25^\circ\text{C}$ .
11. Chip enable ( $\overline{CE}$ ) needs to be tied to CMOS levels to meet the  $I_{SB1}/I_{SB2} / I_{CCDR}$  spec. Other inputs can be left floating.
12. Tested initially and after any design or process changes that may affect these parameters.
13. Full device operation requires linear  $V_{CC}$  ramp from  $V_{DR}$  to  $V_{CC(min)} \geq 100 \mu\text{s}$  or stable at  $V_{CC(min)} \geq 100 \mu\text{s}$ .
14.  $\overline{BHE.BLE}$  is the AND of both  $\overline{BHE}$  and  $\overline{BLE}$ . Deselect the chip by either disabling chip enable signals or by disabling both  $\overline{BHE}$  and  $\overline{BLE}$ .

### Notes

15. In an earlier revision of this device, under a specific application condition, READ and WRITE operations were limited to switching of the byte enable and/or chip enable signals as described in the Application Note [AN66311](#). However, the issue has been fixed and in production now, and hence, this Application Note is no longer applicable. It is available for download on our website as it contains information on the date code of the parts, beyond which the fix has been in production.
16. Test conditions for all parameters other than tri-state parameters assume signal transition time of 3 ns or less, timing reference levels of 1.5 V, input pulse levels of 0 to 3 V, and output loading of the specified IOL/IOH as shown in the [Figure 2 on page 5](#).
17. At any temperature and voltage condition,  $t_{HZCE}$  is less than  $t_{LZCE}$ ,  $t_{HZBE}$  is less than  $t_{LZBE}$ ,  $t_{HZOE}$  is less than  $t_{LZOE}$ , and  $t_{HZWE}$  is less than  $t_{LZWE}$  for any device.
18.  $t_{HZOE}$ ,  $t_{HZCE}$ ,  $t_{HZBE}$ , and  $t_{HZWE}$  transitions are measured when the outputs enter a high-impedance state.
19. If both byte enables are toggled together, this value is 10 ns.
20. The internal write time of the memory is defined by the overlap of  $\overline{WE}$ ,  $\overline{CE} = V_{IL}$ ,  $\overline{BHE}$ ,  $\overline{BLE}$  or both =  $V_{IL}$ . All signals must be active to initiate a write and any of these signals can terminate a write by going inactive. The data input setup and hold timing must be referenced to the edge of the signal that terminates the write.
21. The minimum write cycle pulse width for Write Cycle No. 4 ( $\overline{WE}$  controlled,  $\overline{OE}$  LOW) should be equal to the sum of  $t_{SD}$  and  $t_{HZWE}$ .

## Switching Waveforms

**Figure 4. Read Cycle No. 1 (Address Transition Controlled)** [22, 23]

**Figure 5. Read Cycle No. 2 ( $\overline{\text{OE}}$  Controlled)** [23, 24]

### Notes

22. The device is continuously selected.  $\overline{\text{OE}}$ ,  $\overline{\text{CE}}$  =  $V_{\text{IL}}$ ,  $\overline{\text{BHE}}$ ,  $\overline{\text{BLE}}$ , or both =  $V_{\text{IL}}$ .

23.  $\overline{\text{WE}}$  is HIGH for read cycle.

24. Address valid before or similar to  $\overline{\text{CE}}$ ,  $\overline{\text{BHE}}$ ,  $\overline{\text{BLE}}$  transition LOW.

**Switching Waveforms** (continued)

**Figure 6. Write Cycle No. 1 ( $\overline{\text{WE}}$  Controlled)** [25, 26]

**Figure 7. Write Cycle No. 2 ( $\overline{\text{CE}}$  Controlled)** [25, 26]

**Notes**

25. The internal write time of the memory is defined by the overlap of  $\overline{\text{WE}}$ ,  $\overline{\text{CE}} = V_{\text{IL}}$ ,  $\overline{\text{BHE}}$ ,  $\overline{\text{BLE}}$  or both =  $V_{\text{IL}}$ . All signals must be active to initiate a write and any of these signals can terminate a write by going inactive. The data input setup and hold timing must be referenced to the edge of the signal that terminates the write.

26. If  $\overline{\text{CE}}$  goes HIGH simultaneously with  $\overline{\text{WE}} = V_{\text{IH}}$ , the output remains in a high impedance state.

27. During this period, the I/Os are in output state. Do not apply input signals.

## Switching Waveforms (continued)

**Figure 8. Write Cycle No. 3 ( $\overline{\text{BHE}}/\overline{\text{BLE}}$  Controlled) [28, 29]**

**Figure 9. Write Cycle No. 4 ( $\overline{\text{WE}}$  Controlled,  $\overline{\text{OE}}$  LOW) [28, 29, 31]**

### Notes

28. The internal write time of the memory is defined by the overlap of  $\overline{\text{WE}}$ ,  $\overline{\text{CE}} = V_{IL}$ ,  $\overline{\text{BHE}}$ ,  $\overline{\text{BLE}}$  or both =  $V_{IL}$ . All signals must be active to initiate a write and any of these signals can terminate a write by going inactive. The data input setup and hold timing must be referenced to the edge of the signal that terminates the write.

29. If CE goes HIGH simultaneously with  $\overline{\text{WE}} = V_{IH}$ , the output remains in a high impedance state.

30. During this period, the I/Os are in output state. Do not apply input signals.

31. The minimum write cycle pulse width should be equal to the sum of  $t_{SD}$  and  $t_{HZWE}$ .

## Truth Table

| $\overline{\text{CE}}$ | $\overline{\text{WE}}$ | $\overline{\text{OE}}$ | $\overline{\text{BHE}}$ | $\overline{\text{BLE}}$ | Inputs/Outputs                                                    | Mode                | Power                       |
