1 Overview

RSTA8088GA is a highly integrated System-On-Chip device designed for positioning systems applications.

It combines the high performance of ARM946 microprocessor with embedded enhanced peripherals and I/O capabilities with ST next generation triple-constellation positioning engine. The RF Front-End and Base Band processors are able to support GPS/Galileo and Glonass navigation systems. The device is offered with a complete firmware which performs all positioning operations including tracking, acquisition, navigation and data output with no need of external memories.

It also provides clock generation via PLL, backup logic with real time clock and it supports USB2.0 standard at full speed, (12 Mbps) with on-chip PHY.

RSTA8088GA is software compatible with the ARM processor family. The device is power supplied with 1.8 V and uses three on-chip voltage regulators to internally supply the RF front-End, core logic and the backup logic. In order to reduce the power consumption the chips can be directly powered with 1.2V bypassing the embedded voltage regulators which will be put in power down mode.

I/O lines are compatible with 1.8 V and 3.3 V.

RSTA8088GA, using STMicroelectronics CMOSRF Technology, is housed in either VFQFPN56 (7 x 7 x 0.85 mm) or VFQFPN56 (8 x 8 x 0.85 mm) packages.

RSTA8088GA qualification includes a set of production flow methodology targeting zero defect per million.
