

Hi-performance Regulator IC Series for PCs

2ch Switching Regulators for Desktop PC

BD9540EFV

No.09030EBT07

●Description

BD9540EFV is a 2ch switching regulator synchronous controller that can generate low output voltages (0.75V to 5.5V). High efficiency for the switching regulator can be achieved due to its external N-MOSFET power transistor. The IC also incorporates a new technology called H³Reg™, a Rohm proprietary control method which facilitates ultra-high transient response against changes in load. For protection and ease of use, the IC also incorporates soft start, and short circuit protection with timer latch functions. This switching regulator is designed for DRAM and power supplies for graphics chips.

●Features

- 1) 2ch H³Reg™ DC/DC converter synchronous controller
- 2) Thermal Shut Down (TSD), Under-Voltage Lock-Out (UVLO), Adjustable Over Current Protection (OCP) : detected Low side FET Ron, Over Voltage Protection (OVP), Short Circuit Protection (SCP) built-in
- 3) Soft start function to minimize rush current during startup
- 4) HTSSOP-B28 package
- 5) Built-in 5V power supply for FET driver
- 6) Integrated bootstrap diode

●Applications

LCD-TV, Game Consoles, Desktop PCs

●Maximum Absolute Ratings (Ta=25°C)

Parameter	Symbol	Limit	Unit
Input Voltage	VIN	24 ^{*1}	V
BOOT Voltage	BOOT1,BOOT2	30 ^{*1}	V

Storage Temperature Range	Tstg	-55~+150	°C
Junction Temperature	Tjmax	+150	°C

*1 Not to exceed Pd.

*2 Reduced by 11.6mW for each increase in Ta of 1°C over 25°C
(when mounted on a board 70.0mm × 70mm × 1.6mm Glass-epoxy PCB, 1layer, no copper foil area.)

*3 Reduced by 14.8mW for increase in Ta of 1°C over 25°C.
(when mounted on a board 70.0mm × 70mm × 1.6mm Glass-epoxy PCB, 2layers, copper foil area : 15mm × 15mm.)

*4 Reduced by 26.4mW for increase in Ta of 1°C over 25°C.
(when mounted on a board 70.0mm × 70mm × 1.6mm Glass-epoxy PCB, 2layers, copper foil area : 70mm × 70mm.)

*5 Reduced by 37.6mW for increase in Ta of 1°C over 25°C.
(when mounted on a board 70.0mm × 70mm × 1.6mm Glass-epoxy PCB, 4layers, copper foil area : 70mm × 70mm.)

● Operating Conditions (Ta=25°C)

Parameter	Symbol	Min.	Max.	Unit
Input voltage	VIN	7.5	20	V
BOOT voltage	BOOT1, BOOT2	4.5	25	V
SW Voltage	SW1, SW2	-0.7	20	V
BOOT-SW voltage	BOOT1-SW1, BOOT2-SW2	4.5	5.5	V
Logic Input Voltage 1	EN1, EN2	0	20	V
Logic Input Voltage 2	CTL1, CTL2	0	5.5	V
Output Voltage	VOUT1, VOUT2	0.7	5.5	V
MIN ON Time	tonmin	-	100	ns

*This product should not be used in a radioactive environment.

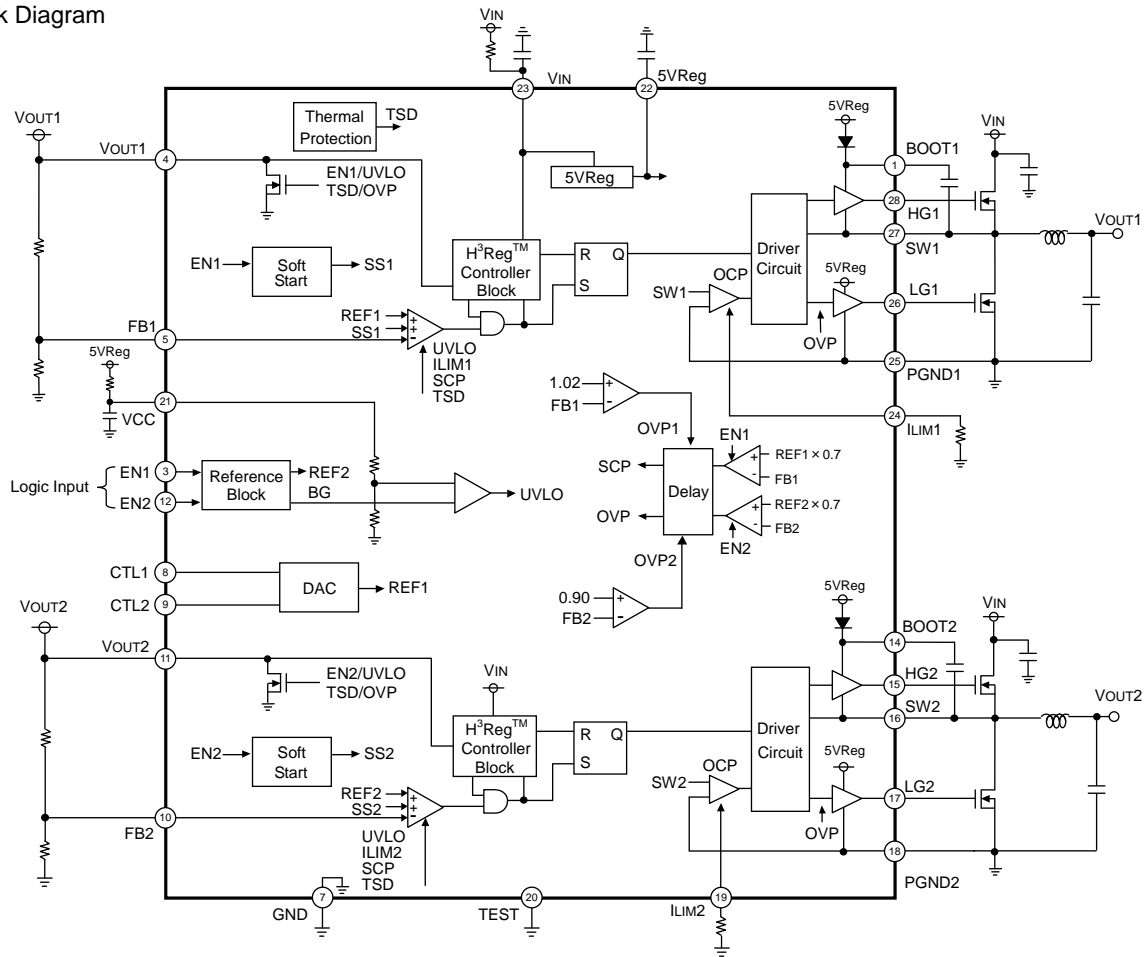

*The range of the VOUT is limited by the voltage between VIN and VOUT.

● Electrical characteristics

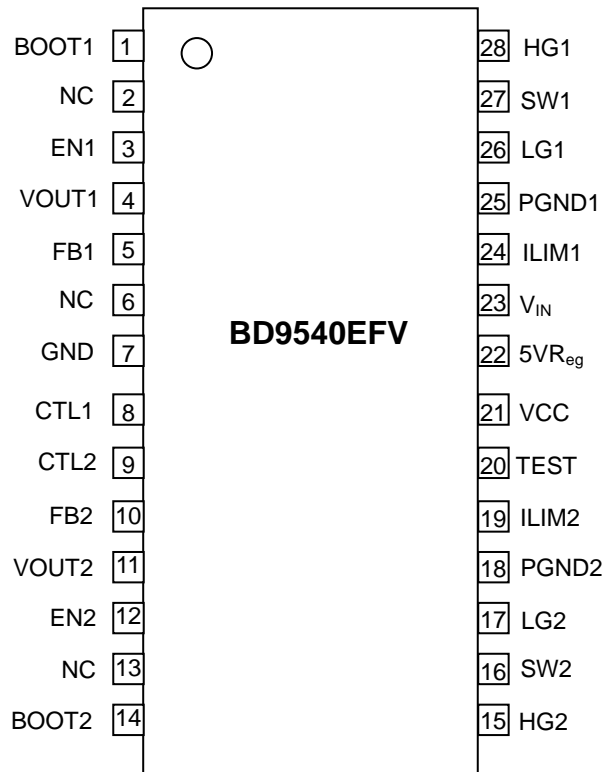

(Unless otherwise noted, Ta=25°C VCC=5V, VIN=12V, VEN1=VEN2=3V, Vout1=1.5V, Vout2=1.05V)

●Block Diagram

●Pin Configuration

●Pin Function

PIN No.	PIN name	PIN Function
1	BOOT1	HG Driver Power Supply Pin 1
2	NC	Non connection Pin
3	EN1	Enable Input Pin 1 (0~0.3V:OFF, 2.2~20V:ON)
4	VOUT1	Output Voltage Sence Pin 1
5	FB1	Output Voltage Feedback Pin 1
6	NC	Non connection Pin
7	GND	Sense GND
8	CTL1	1ch Reference Voltage Setting Control Pin 1:See P12/17
9	CTL2	1ch Reference Voltage Setting Control Pin 2:See P12/17
10	FB2	Output Voltage Feedback Pin 2
11	VOUT2	Output Voltage Sense Pin 2
12	EN2	Enable Input Pin 2 (0~0.3V:OFF, 2.2~20V:ON)
13	NC	Non connection Pin
14	BOOT2	HG Driver Power Supply Pin 2
15	HG2	High side FET Gate Driver Pin 2
16	SW2	High side FET Source Pin 2
17	LG2	Low side FET Gate Driver Pin 2
18	PGND2	Power GND for 2ch
19	ILIM2	2ch OCP Setting Pin
20	TEST	Connect to GND Pin
21	VCC	Power Supply Input Pin
22	5VReg	Reference Voltage Inside IC (5V Voltage Output)
23	VIN	Battery Voltage Sense Pin
24	ILIM1	1ch OCP Setting Pin
25	PGND1	Power GND for 1ch
26	LG1	Low side FET Gate Driver Pin 1
27	SW1	High side FET Source Pin 1
28	HG1	High side FET Gate Driver Pin 1
reverse	FIN	Exposed Pad, Connect to GND

● Pin Descriptions

- EN1 (3 pin) / EN2 (12 pin)
When the input voltage on the EN pin reaches at least 2.2V, the switching regulator becomes active.
At voltages less than 0.3 V, the switching regulator becomes inactive, and the input current drops to 10 μ A or less.
Thus the IC can be controlled from 2.5V, 3.3V or 5V power supplies.
- 5VReg (22 pin)
5.0V reference voltage output pin. If at least 2.2V is supplied to either the EN1 or EN2 pin, the reference output is switched on.
This pin supplies 5.0V at up to 10mA. Inserting a 4.7 μ F capacitor (with a X5R or X7R rating) between the 5VReg and GND pins is recommended.
- ILIM1 (24 pin) / ILIM2 (19 pin)
The IC monitors the voltage between the SW pin and PGND pin as a control for the output current protection (OCP) mechanism.
The voltage at which OCP engages is determined by the resistance value connected to the ILIM pin.
This also allows for compatibility with FETs of various RON values.
- VIN (23 pin)
The IC determines the duty cycles internally based upon the input voltage on this pin. Therefore, variations in voltage on this pin can lead to highly unstable operation. This pin also acts as the voltage input to the internal switching regulator block, and is sensitive to the impedance of the power supply. Attaching a bypass capacitor or RC filter on this pin as appropriate for the application is recommended.
- BOOT1 (1 pin) / BOOT2 (14 pin)
This pin supplies voltage used for driving the high-side FET. Maximum absolute ratings are 25V from GND and 5.5V from SW. BOOT voltage swings between VIN + 5VReg and 5VReg during active operation.
- HG1 (28 pin) / HG2 (15 pin)
This pin supplies voltage used for driving the gate of the high-side FET. This voltage swings between BOOT and SW. High-speed gate driving for the high side FET can be achieved due to its low on-resistance (5.5 Ω when HG = high, 2.5 Ω when HG = low) of the driver.
- SW1 (27 pin) / SW2 (16 pin)
This pin acts as the source connection to the high-side FET. Maximum absolute rating is 20V from GND.
SW voltage swings between VIN and GND.
- LG1 (26 pin) / LG2 (17 pin)
This pin supplies voltage used for driving the gate of the low-side FET. This voltage swings between VDD and PGND.
High-speed gate driving for the low-side FET can be achieved due to its low on-resistance (4 Ω when LG = high, 2 Ω when LG = low) of the driver.
- PGND1 (25 pin) / PGND2 (18 pin)
This pin acts as the ground connection to the source of the low-side FET.
- GND (7 pin)
This is the ground pin for all internal analog and digital power supplies.
- VOUT1 (4 pin) / VOUT2 (11 pin)
This is the output voltage sense pin; this pin features an integrated discharge FET used to discharge the output capacitor when status is set to OFF.
- FB1 (5 pin) / FB2 (10 pin)
This is the output feedback pin. While the internal reference voltage of channel 2 is fixed at 0.750V, the internal reference voltage of channel 1 is adjustable depending on the input conditions of the CTL1 and CTL2 pins.
- Vcc (21 pin)
This is the power supply pin for all internal circuitry. This pin can be supplied directly by a 5V source, or via an RC filter (10 Ω , 0.01 μ F) from the 5VReg pin.
- CTL1 (8 pin) / CTL2 (9 pin)
These pins allow for the adjustment of the internal voltage reference (REF1) for channel 1. The pins recognize logic High at VCC-0.5 V or above, and logic Low at 0.5 V or below. Refer to the voltage adjustment table for REF1 on page 12.

●Explanation of Operation

The BD9540EFV is a 2ch switching regulator controller incorporating ROHM's proprietary H³Reg™ CONTROLLA control system. When VOUT drops due to a rapid load change, the system quickly restores VOUT by extending the TON time interval.

H³Reg™ control
(Normal operation)

When FB falls below the threshold voltage (REF), a drop is detected, activating the H³Reg™ CONTROLLA system.

$$t_{ON} = \frac{V_{OUT}}{V_{IN}} \times \frac{1}{f} \text{ [sec]} \dots (1)$$

HG output is determined by the formula above. (See P13)
LG output operates until FB voltage falls below REF voltage after HG becomes OFF.

(VOUT drops due to a rapid load change)

When FB (VOUT) drops due to a rapid load change, and the voltage remains below REF after the programmed ton time interval has elapsed, the system quickly restores VOUT by extending the ton time, improving transient response.

●Timing Chart

• Soft Start Function

Soft start is utilized when the EN pin is set high. Current control takes effect at startup, enabling a moderate "ramping start" on the output voltage. Soft start time is 1msec. And input current is determined via formula (2) below.

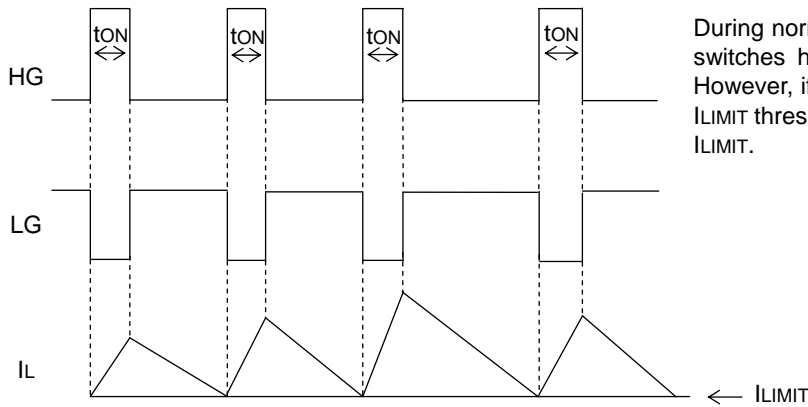

Rush current:

$$I_{IN} = \frac{C_o \times V_{OUT}}{1ms} \text{ [A]} \dots (2)$$

(Co: All capacitors connected with VOUT)

●Timing Chart

- Over current protection circuit

During normal operation, when FB falls below REF, HG switches high during for the period of time t_{ON} (P8). However, if the current of the low-side FET exceeds the I_{LIMIT} threshold, HG will switch off until it becomes below I_{LIMIT} .

- Timer Latch Type Short Circuit Protection

Short protection engages when output falls to or below $REF \times 0.7$. When the programmed time period ($28\mu s$) elapses, output is latched off to prevent damage to the IC. Output voltage can be restored either by reconnecting the EN pin or disabling UVLO.

- Output Over Voltage Protection

When output voltage rises to or above the OVP threshold voltage (1ch:1.02V, 2ch:0.9V), output over-voltage protection engages after the set time ($1.7\mu s$) has elapsed. During this protection period, the low-side FET opens completely for maximum reduction of output voltage (LG = high, HG = low). Output voltage can be restored either by reconnecting the EN pin or disabling UVLO.

●External Component Selection

1. Inductor (L) selection

Output Ripple Current

The inductance value has a major influence on output ripple current. As formula (3) below indicates, the greater the inductance or switching frequency, the lower the ripple current.

$$\Delta I_L = \frac{(V_{IN} - V_{OUT}) \times V_{OUT}}{L \times V_{IN} \times f} \quad [A] \dots (3)$$

The proper output ripple current setting is about 30% of maximum output current.

$$\Delta I_L = 0.3 \times I_{OUTmax} \quad [A] \dots (4)$$

$$L = \frac{(V_{IN} - V_{OUT}) \times V_{OUT}}{\Delta I_L \times V_{IN} \times f} \quad [H] \dots (5)$$

(ΔI_L : output ripple current; f: switch frequency)

※Passing a current larger than the inductor's rated current will cause magnetic saturation in the inductor and decrease system efficiency. When selecting an inductor, be sure to allow enough margin to assure that peak current does not exceed the inductor's rated current value.

※To minimize possible inductor damage and maximize efficiency, choose an inductor with a low (DCR, ACR) resistance.

2. Output Capacitor (CO) Selection

Output Capacitor

When determining a proper output capacitor, be sure to factor in the equivalent series resistance and equivalent series inductance required to set the output ripple voltage to 20mV or more. Also, make sure the capacitor's voltage rating is high enough for the set output voltage (including ripple). Output ripple voltage is determined as in formula (6) below.

$$\Delta V_{OUT} = \Delta I_L \times ESR + ESL \times \Delta I_L / T_{ON} \dots (6)$$

(ΔI_L : Output ripple current; ESR: Co equivalent series resistance, ESL: equivalent series inductance)

Also, give due consideration to the conditions in formula (7) below for output capacitance, bearing in mind that output rise time must be established within the soft start time frame:

$$C_o \leq \frac{1ms \times (Limit - I_{OUT})}{V_{OUT}} \dots (7)$$

Tss: Soft start time
Limit: Over current detection
I_{OUT}: Output current

Note: an improper output capacitor may cause startup malfunctions.

3. Input Capacitor (Cin) Selection

Input Capacitor

In order to prevent transient spikes in voltage, the input capacitor selected must have a low enough ESR resistance to fully support a large ripple current on the output. The formula for ripple current IRMS is given in equation (8) below:

$$I_{RMS} = I_{OUT} \times \frac{\sqrt{V_{OUT} (V_{IN} - V_{OUT})}}{V_{IN}} \quad [A] \dots (8)$$

Where $V_{IN} = 2 \times V_{OUT}$, $I_{RMS} = \frac{I_{OUT}}{2}$

A low-ESR capacitor is recommended to reduce ESR loss and maximize efficiency.

4. MOSFET Selection

Main MOSFET power dissipation is computed as follows:

$$P_{main} = P_{RON} + P_{GATE} + P_{TRAN}$$

$$= \frac{V_{OUT}}{V_{IN}} \times R_{ON} \times I_{OUT}^2 + Q_g(\text{High}) \times f \times 5V_{Reg} + \frac{V_{IN}^2 \times C_{rss} \times I_{OUT} \times f}{I_{DRIVE}} \dots (9)$$

(R_{ON} : On-resistance of FET; Q_g : FET gate capacitance; f : Switching frequency; C_{rss} : FET inverse transfer function; I_{DRIVE} : Gate peak current)

Synchronous MOSFET power dissipation is computed as follows:

$$P_{syn} = P_{RON} + P_{GATE}$$

$$= \frac{V_{IN} - V_{OUT}}{V_{IN}} \times R_{ON} \times I_{OUT}^2 + 5V_{Reg} \times f \times V_{DD} \dots (10)$$

Q_g loss is also incurred as internal power dissipation in the IC:

$$P_{IC(DRIVE)} = \{ Q_g(\text{High}) \times f + Q_g(\text{Low}) \} \times (V_{IN} - 5V_{Reg}) \dots (11)$$

For example:

If $Q_g(\text{High}) = 20\text{nq}$, $Q_g(\text{Low}) = 50\text{nq}$, $f = 300\text{kHz}$,

$$P_{IC(DRIVE)} = \{ 20\text{n} \times 300\text{k} + 50\text{n} \times 300\text{k} \} \times (12-5)$$

$$= 0.147\text{W}$$

5. Determining Detection Resistance

The over-current protection function is controlled via the voltage detected between the SW and PGND pins – i.e., the ON-resistance of the synchronous FET. The current limit value is determined by formula (12) below:

$$I_{LIM} = \frac{10\text{k}}{R_{ILIM} \times R_{ON}} \text{ [A]} \dots (12)$$

(R_{ILIM} : Resistance for setting over-current protection limit, R_{ON} : Low side FET On-resistance)

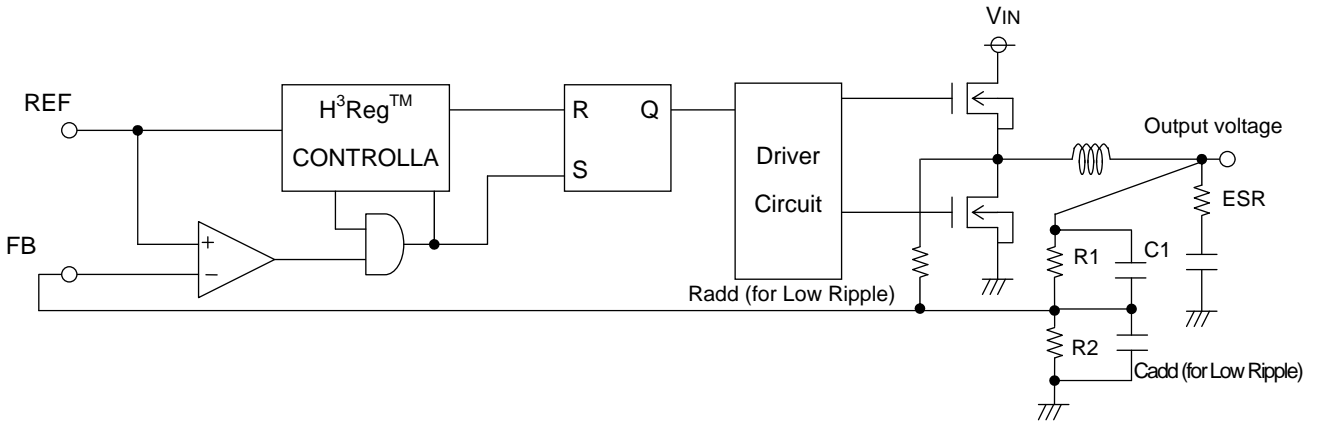

6. Output Voltage Setting

The IC will try to maintain output voltage such that $REF \cong V_{FB}$.

However, the actual output voltage will also reflect the average ripple voltage value.

The output voltage is set via a resistive voltage divider between the output and the FB pin. The formula for output voltage is given in (13) below:

$$\text{Output voltage} = \frac{R1+R2}{R2} \times REF + \frac{1}{2} \times \Delta I_L \times ESR \dots (13)$$

It is recommended that R1 and C1 be connected in parallel to the FB pin.

In low output ripple applications ($\Delta V < 20 \text{ mV}$), add Radd and Cadd as shown in the above application circuit.

For value settings, refer to the tool provided separately.

REF voltage (for 2ch) is fixed at 0.750 V; however, REF voltage (for 1ch) can be adjusted via the CTL input conditions.
REF1 voltage setting table

CTL1	CTL2	REF1
L	L	0.781V
H	L	0.814V
L	H	0.851V
H	H	0.750V

7. Relationship between output voltage and Ton duration

Both 1ch and 2ch of BD9540EFV are synchronous rectification type of switching controllers operated at fixed-frequency. The Ton duration for each channel depends on the output voltage settings, as described by the following formulas.

$$\text{Ton1} = \frac{\text{VOUT1}}{\text{VIN}} \times 2\mu + 130\text{n [ns]} \cdot \cdot \cdot (14) \quad (1\text{ch})$$

$$\text{Ton2} = \frac{\text{VOUT2}}{\text{VIN}} \times 0.9\mu + 130\text{n [ns]} \cdot \cdot \cdot (15) \quad (2\text{ch})$$

Thus from the above Ton duration, the frequency of the applied condition is

$$\text{Frequency} = \frac{\text{VOUT}}{\text{VIN}} \times \frac{1}{\text{Ton}} \text{ [kHz]} \cdot \cdot \cdot (16)$$

However with actual applications, there exists a rising and falling time of the SW due to the gate capacitance of the external MOSFET and the switching speed, which may vary the above parameters. Thus please also verify those parameters experimentally.

8. Relationship between output current and frequency

BD9540EFV is a fixed-Ton type of switching controller. When the output current increases, the switching loss of the coil and MOSFET also increases and hence the switching frequency speeds up.

The loss of the coil and MOSFET is determined as

$$\textcircled{1} \text{ Loss of coil} = \text{IOUT}^2 \times \text{DCR}$$

$$\textcircled{2} \text{ Loss of high-side MOSFET} = \text{IOUT}^2 \times \text{Ronh} \times \frac{\text{VOUT}}{\text{VIN}}$$

$$\textcircled{3} \text{ Loss of low-side MOSFET} = \text{IOUT}^2 \times \text{Ronn} \times \left(1 - \frac{\text{VOUT}}{\text{VIN}}\right)$$

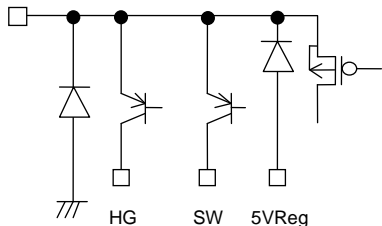

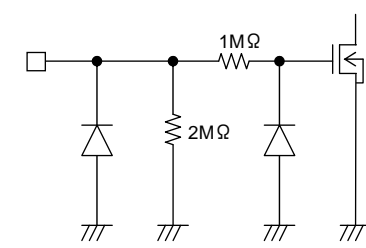

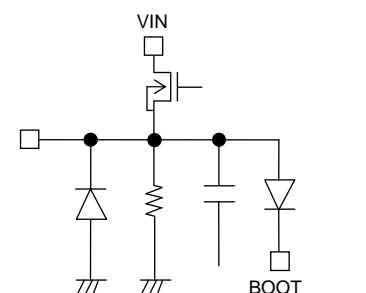

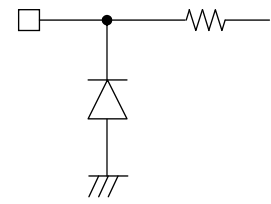

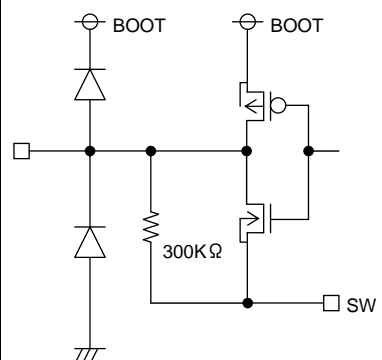

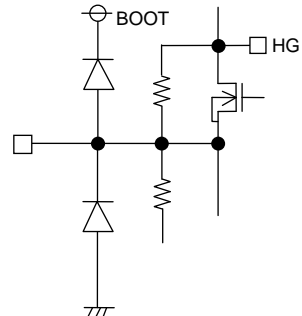

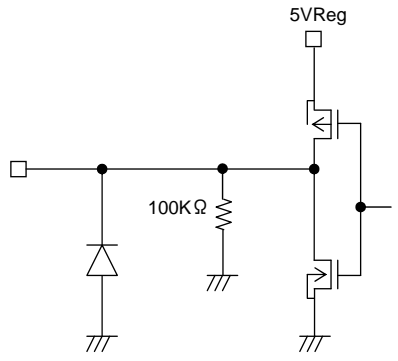

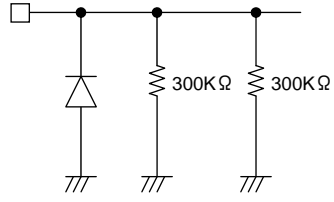

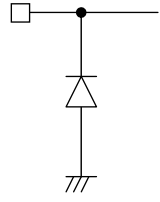

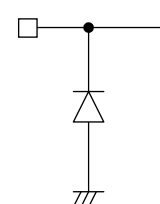

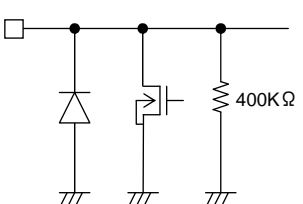

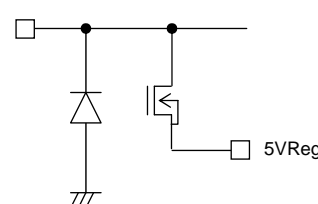

(Ronh : on-resistance of high-side MOSFET, Ronn : on resistance of low-side MOSFET)

Taking the above losses into the frequency equation, then T (=1/Freq) becomes

$$T (=1/\text{Freq}) = \frac{\text{VIN} \times \text{IOUT} \times \text{Ton}}{\text{VOUT} \times \text{IOUT} + \textcircled{1} + \textcircled{2} + \textcircled{3}} \cdot \cdot \cdot (17)$$

However since the parasitic resistance of the layout pattern exists in actual applications and affects the parameter, please also verify experimentally.

● Operation Notes

(1) Absolute Maximum Ratings

Use of the IC in excess of absolute maximum ratings (such as the input voltage or operating temperature range) may result in damage to the IC. Assumptions should not be made regarding the state of the IC (e.g., short mode or open mode) when such damage is suffered. If operational values are expected to exceed the maximum ratings for the device, consider adding protective circuitry (such as fuses) to eliminate the risk of damaging the IC.

(2) Power Supply Polarity

Connecting the power supply in reverse polarity can cause damage to the IC. Take precautions when connecting the power supply lines. An external power diode can be added.

(3) Power Supply Lines

In order to minimize noise, PCB layout should be designed such that separate, low-impedance power lines are routed to the digital and analog blocks. Additionally, a coupling capacitor should be inserted between all power input pins and the ground terminal. If electrolytic capacitors are used, keep in mind that their capacitance characteristics are reduced at low temperatures.

(4) GND voltage

The potential of the GND pin must be the minimum potential in the system in all operating conditions.

(5) Thermal design

Use a thermal design that allows for a sufficient margin for power dissipation (Pd) under actual operating conditions.

(6) Inter-pin Shorts and Mounting Errors

Use caution when orienting and positioning the IC for mounting on printed circuit boards. Improper mounting may result in damage to the IC. Shorts between output pins or between output pins and the power supply and GND pins caused by poor soldering or foreign objects may result in damage to the IC.

(7) Operation in Strong Electromagnetic Fields

Using this product in strong electromagnetic fields may cause IC malfunction. Caution should be exercised in applications where strong electromagnetic fields may be present.

(8) ASO - Area of Safe Operation

When using the IC, ensure that operating conditions do not exceed absolute maximum ratings or ASO of the output transistors.

(9) Thermal shutdown (TSD) circuit

The IC incorporates a built-in thermal shutdown circuit, which is designed to turn the IC off completely in the event of thermal overload. It is not designed to protect the IC from damage or guarantee its operation. ICs should not be used after this function has activated, or in applications where the operation of this circuit is assumed.

	TSD ON Temp. [°C] (typ.)	Hysteresis Temp. [°C] (typ.)
BD9540EFV	175	15

(10) Testing on application boards

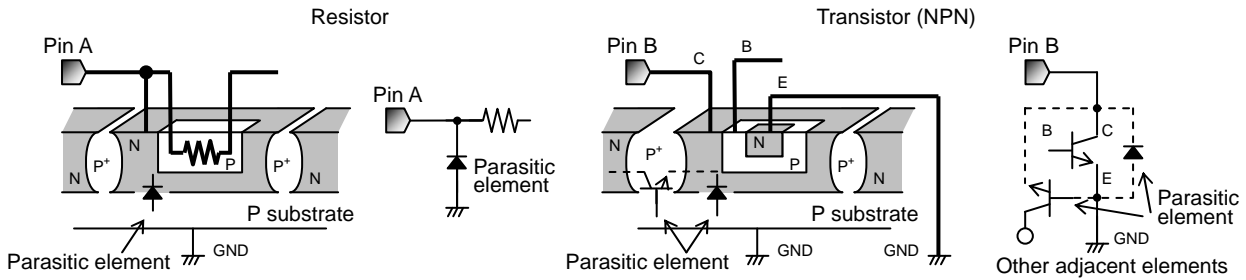

When testing the IC on an application board, connecting a capacitor directly to a low-impedance pin may subject the IC to stress. Always discharge capacitors completely after each process or step. The IC's power supply should always be turned off completely before connecting or removing it from a jig or fixture during the evaluation process. To prevent damage from static discharge, ground the IC during assembly and use similar precautions during transport and storage.

(11) Regarding input pins of the IC

This monolithic IC contains P+ isolation and P substrate layers between adjacent elements in order to keep them isolated. PN junctions are formed at the intersection of these P layers with the N layers of other elements, creating parasitic diodes and/or transistors. For example (refer to the figure below):

- When GND > Pin A and GND > Pin B, the PN junction operates as a parasitic diode
- When GND > Pin B, the PN junction operates as a parasitic transistor

Parasitic diodes occur inevitably in the structure of the IC, and the operation of these parasitic diodes can result in mutual interference among circuits, operational faults, or physical damage. Accordingly, conditions that cause these diodes to operate, such as applying a voltage lower than the GND voltage to an input pin (and thus to the P substrate) should be avoided.

Example of IC structure

(12) Ground Wiring Pattern

When using both small-signal and large-current GND traces, the two ground traces should be routed separately but connected to a single ground potential within the application in order to avoid variations in the small-signal ground caused by large currents. Also ensure that the GND traces of external components do not cause variations on GND voltage.

● Power Dissipation

- ① Mounted on board 70mm × 70mm × 1.6mm glass-epoxy PCB, 1 layer
No copper foil area. $\theta_{j-a}=86.2^{\circ}\text{C/W}$
- ② Mounted on board 70mm × 70mm × 1.6mm glass-epoxy PCB, 2 layers,
Copper foil area : 15mm × 15mm, $\theta_{j-a}=67.6^{\circ}\text{C/W}$
- ③ Mounted on board 70mm × 70mm × 1.6mm glass-epoxy PCB, 2 layers,
Copper foil area :: 70mm × 70mm, $\theta_{j-a}=37.9^{\circ}\text{C/W}$
- ④ Mounted on board 70mm × 70mm × 1.6mm glass-epoxy PCB, 4 layers,
Copper foil area :: 70mm × 70mm, $\theta_{j-a}=26.6^{\circ}\text{C/W}$

● Ordering part number

HTSSOP-B28

Notice

Precaution on using ROHM Products

- Our Products are designed and manufactured for application in ordinary electronic equipments (such as AV equipment, OA equipment, telecommunication equipment, home electronic appliances, amusement equipment, etc.). If you intend to use our Products in devices requiring extremely high reliability (such as medical equipment ^(Note 1), transport equipment, traffic equipment, aircraft/spacecraft, nuclear power controllers, fuel controllers, car equipment including car accessories, safety devices, etc.) and whose malfunction or failure may cause loss of human life, bodily injury or serious damage to property ("Specific Applications"), please consult with the ROHM sales representative in advance. Unless otherwise agreed in writing by ROHM in advance, ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of any ROHM's Products for Specific Applications.

(Note1) Medical Equipment Classification of the Specific Applications

JAPAN	USA	EU	CHINA
CLASS III	CLASS III	CLASS II b	CLASS III
CLASS IV		CLASS III	

- ROHM designs and manufactures its Products subject to strict quality control system. However, semiconductor products can fail or malfunction at a certain rate. Please be sure to implement, at your own responsibilities, adequate safety measures including but not limited to fail-safe design against the physical injury, damage to any property, which a failure or malfunction of our Products may cause. The following are examples of safety measures:
 - Installation of protection circuits or other protective devices to improve system safety
 - Installation of redundant circuits to reduce the impact of single or multiple circuit failure
- Our Products are designed and manufactured for use under standard conditions and not under any special or extraordinary environments or conditions, as exemplified below. Accordingly, ROHM shall not be in any way responsible or liable for any damages, expenses or losses arising from the use of any ROHM's Products under any special or extraordinary environments or conditions. If you intend to use our Products under any special or extraordinary environments or conditions (as exemplified below), your independent verification and confirmation of product performance, reliability, etc. prior to use, must be necessary:
 - Use of our Products in any types of liquid, including water, oils, chemicals, and organic solvents
 - Use of our Products outdoors or in places where the Products are exposed to direct sunlight or dust
 - Use of our Products in places where the Products are exposed to sea wind or corrosive gases, including Cl₂, H₂S, NH₃, SO₂, and NO₂
 - Use of our Products in places where the Products are exposed to static electricity or electromagnetic waves
 - Use of our Products in proximity to heat-producing components, plastic cords, or other flammable items
 - Sealing or coating our Products with resin or other coating materials
 - Use of our Products without cleaning residue of flux (even if you use no-clean type fluxes, cleaning residue of flux is recommended); or Washing our Products by using water or water-soluble cleaning agents for cleaning residue after soldering
 - Use of the Products in places subject to dew condensation
- The Products are not subject to radiation-proof design.
- Please verify and confirm characteristics of the final or mounted products in using the Products.
- In particular, if a transient load (a large amount of load applied in a short period of time, such as pulse. is applied, confirmation of performance characteristics after on-board mounting is strongly recommended. Avoid applying power exceeding normal rated power; exceeding the power rating under steady-state loading condition may negatively affect product performance and reliability.
- De-rate Power Dissipation (Pd) depending on Ambient temperature (Ta). When used in sealed area, confirm the actual ambient temperature.
- Confirm that operation temperature is within the specified range described in the product specification.
- ROHM shall not be in any way responsible or liable for failure induced under deviant condition from what is defined in this document.

Precaution for Mounting / Circuit board design

- When a highly active halogenous (chlorine, bromine, etc.) flux is used, the residue of flux may negatively affect product performance and reliability.
- In principle, the reflow soldering method must be used; if flow soldering method is preferred, please consult with the ROHM representative in advance.

For details, please refer to ROHM Mounting specification

Precautions Regarding Application Examples and External Circuits

1. If change is made to the constant of an external circuit, please allow a sufficient margin considering variations of the characteristics of the Products and external components, including transient characteristics, as well as static characteristics.
2. You agree that application notes, reference designs, and associated data and information contained in this document are presented only as guidance for Products use. Therefore, in case you use such information, you are solely responsible for it and you must exercise your own independent verification and judgment in the use of such information contained in this document. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of such information.

Precaution for Electrostatic

This Product is electrostatic sensitive product, which may be damaged due to electrostatic discharge. Please take proper caution in your manufacturing process and storage so that voltage exceeding the Products maximum rating will not be applied to Products. Please take special care under dry condition (e.g. Grounding of human body / equipment / solder iron, isolation from charged objects, setting of ionizer, friction prevention and temperature / humidity control).

Precaution for Storage / Transportation

1. Product performance and soldered connections may deteriorate if the Products are stored in the places where:
 - [a] the Products are exposed to sea winds or corrosive gases, including Cl₂, H₂S, NH₃, SO₂, and NO₂
 - [b] the temperature or humidity exceeds those recommended by ROHM
 - [c] the Products are exposed to direct sunshine or condensation
 - [d] the Products are exposed to high Electrostatic
2. Even under ROHM recommended storage condition, solderability of products out of recommended storage time period may be degraded. It is strongly recommended to confirm solderability before using Products of which storage time is exceeding the recommended storage time period.
3. Store / transport cartons in the correct direction, which is indicated on a carton with a symbol. Otherwise bent leads may occur due to excessive stress applied when dropping of a carton.
4. Use Products within the specified time after opening a humidity barrier bag. Baking is required before using Products of which storage time is exceeding the recommended storage time period.

Precaution for Product Label

QR code printed on ROHM Products label is for ROHM's internal use only.

Precaution for Disposition

When disposing Products please dispose them properly using an authorized industry waste company.

Precaution for Foreign Exchange and Foreign Trade act

Since our Products might fall under controlled goods prescribed by the applicable foreign exchange and foreign trade act, please consult with ROHM representative in case of export.

Precaution Regarding Intellectual Property Rights

1. All information and data including but not limited to application example contained in this document is for reference only. ROHM does not warrant that foregoing information or data will not infringe any intellectual property rights or any other rights of any third party regarding such information or data. ROHM shall not be in any way responsible or liable for infringement of any intellectual property rights or other damages arising from use of such information or data.:
2. No license, expressly or implied, is granted hereby under any intellectual property rights or other rights of ROHM or any third parties with respect to the information contained in this document.

Other Precaution

1. This document may not be reprinted or reproduced, in whole or in part, without prior written consent of ROHM.
2. The Products may not be disassembled, converted, modified, reproduced or otherwise changed without prior written consent of ROHM.
3. In no event shall you use in any way whatsoever the Products and the related technical information contained in the Products or this document for any military purposes, including but not limited to, the development of mass-destruction weapons.
4. The proper names of companies or products described in this document are trademarks or registered trademarks of ROHM, its affiliated companies or third parties.

General Precaution

1. Before you use our Products, you are requested to carefully read this document and fully understand its contents. ROHM shall not be in any way responsible or liable for failure, malfunction or accident arising from the use of any ROHM's Products against warning, caution or note contained in this document.
2. All information contained in this document is current as of the issuing date and subject to change without any prior notice. Before purchasing or using ROHM's Products, please confirm the latest information with a ROHM sales representative.
3. The information contained in this document is provided on an "as is" basis and ROHM does not warrant that all information contained in this document is accurate and/or error-free. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties resulting from inaccuracy or errors of or concerning such information.
