## LDO Regulator, 300 mA, Low Dropout Voltage, Ultra Low Noise, High PSRR with Power Good

## NCP164C

The NCP164C is a 300 mA LDO, next generation of high PSRR, ultra-low noise and low dropout regulators with Power Good open collector output. Designed to meet the requirements of RF and sensitive analog circuits, the NCP164C device provides ultra-low noise, high PSRR and low quiescent current. The device also offer excellent load/line transients. The NCP164C is designed to work with a 1  $\mu F$  input and a 1  $\mu F$  output ceramic capacitor. It is available in industry standard TSOP-5, WDFN6 0.65P, 2 mm x 2 mm and DFNW8 0.65P, 3 mm x 3 mm.

#### **Features**

- Operating Input Voltage Range: 1.6 V to 5.0 V
- Available in Fixed Voltage Option: 1.2 V to 4.5 V
- Adjustable Version Reference Voltage: 1.1 V
- ±2% Accuracy Over Load and Temperature
- Ultra Low Quiescent Current Typ. 30 μA
- Standby Current: Typ. 0.1 μA
- Very Low Dropout: 110 mV at 300 mA for 3.3 V Variant
- Ultra High PSRR: Typ. 85 dB at 10 mA, f = 1 kHz
- Ultra Low Noise: 9 μV<sub>RMS</sub> (Fixed Version)
- Stable with a 1 µF Small Case Size Ceramic Capacitors
- Available in TSOP–5 3 mm x 1.5 mm x 1 mm CASE 483
  - ◆ WDFN6 2 mm x 2 mm x 0.75 mm CASE 511BR
  - ◆ DFNW8 3 mm x 3 mm x 0.9 mm CASE 507AD
- These Devices are Pb–Free, Halogen Free/BFR Free and are RoHS Compliant

## **Typical Applications**

- Communication Systems
- In-Vehicle Networking
- Telematics, Infotainment and Clusters
- General Purpose Automotive

## **PIN CONNECTONS**

### **ORDERING INFORMATION**

See detailed ordering and shipping information on page 8 of this data sheet.

**Table 1. PIN FUNCTION DESCRIPTION** 

| Pin No.<br>TSOP-5 | Pin No.<br>WDFN6 | Pin No.<br>DFNW8 | Pin<br>Name | Description   |
|-------------------|------------------|------------------|-------------|---|
| 1                 | 6                | 8                | IN          | Input voltage supply pin  |
| 5                 | 1                | 1                | OUT         | Regulated output voltage. The output should be bypassed with small 1 $\ensuremath{\mu F}$ ceramic capacitor           |
| 3                 | 4                | 7                | EN          | Chip enable: Applying $V_{EN} < 0.2 \ V$ disables the regulator, Pulling $V_{EN} > 0.7 \ V$ enables the LDO           |
| 4 / –             | 3                | 3                | PG          | Power Good, open collector. Use 10 k $\Omega$ to 100 k $\Omega$ pull–up resistor connected to output or input voltage |
| 2                 | 5                | 6                | GND         | Common ground connection  |
| - / 4             | 2                | 2                | ADJ         | Adjustable output feedback pin (for adjustable version only)  |
| -                 | 2                | 2                | SNS         | Sense feedback pin. Must be connected to OUT pin on PCB (for fixed versions only)                                     |
| -                 | -                | 4, 5             | N/C         | Not connected, pin can be tied to ground plane for better power dissipation   |
| _                 | EPAD             | EPAD             | EPAD        | Expose pad should be tied to ground plane for better power dissipation  |

#### **Table 2. ABSOLUTE MAXIMUM RATINGS**

| Rating  | Symbol             | Value                                  | Unit |
|---|--------------------|--|------|
| Input Voltage (Note 1)                        | V <sub>IN</sub>    | -0.3 to 5.3                            | V    |
| Output Voltage                                | V <sub>OUT</sub>   | -0.3 to V <sub>IN</sub> +0.3, max. 5.3 | V    |
| Chip Enable Input                             | V <sub>CE</sub>    | -0.3 to 5.3                            | V    |
| Power Good Voltage                            | $V_{PG}$           | -0.3 to 5.3                            | V    |
| Power Good Current                            | I <sub>PG</sub>    | 30                                     | mA   |

| Characterization Parameter, Junction-to-Top            | $\Psi_{JT}$          | 1.9   | °C/W |
| Characterization Parameter, Junction-to-Board          | $\Psi_{JB}$          | 7.7   | °C/W |
| THERMAL CHARACTERISTICS, DFNW8-3X3, 0.65 PITCH PACKAGE |                      |       |      |
| Thermal Resistance, Junction-to-Ambient (Note 3)       | $R_{	hetaJA}$        | 50    | °C/W |
| Thermal Resistance, Junction-to-Case (top)             | $R_{\theta JC(top)}$ | 142   | °C/W |
| Thermal Resistance, Junction-to-Case (bottom) (Note 4) | $R_{\theta JC(bot)}$ | 7.9   | °C/W |
| Thermal Resistance, Junction-to-Board                  | $R_{	hetaJB}$        | 125   | °C/W |
| Characterization Parameter, Junction-to-Top            | $\Psi_{JT}$          | 2.0   | °C/W |
| Characterization Parameter, Junction-to-Board          | $\Psi_{JB}$          | 7.5   | °C/W |

The junction-to-ambient thermal resistance under natural convection is obtained in a simulation on a high-K board, following the JEDEC51.7 guidelines with assumptions as above, in an environment described in JESD51-2a.
 The junction-to-case (bottom) thermal resistance is obtained by simulating a cold plate test on the IC exposed pad. Test description can be found in the ANSI SEMI standard G30-88.

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

<sup>5.</sup> Performance guaranteed over the indicated operating temperature range by design and/or characterization. Production tested at  $T_J = T_A = 25^{\circ}C$ .

<sup>6.</sup> Low duty cycle pulse techniques are used during the testing to maintain the junction temperature as close to ambient as possible. Dropout voltage is characterized when V<sub>OUT</sub> falls 3% below V<sub>OUT(NOM)</sub>.

7. Guaranteed by design and characterization.

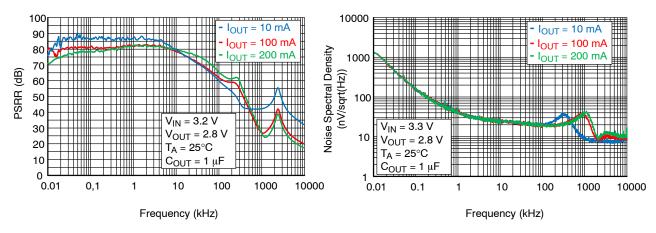

Figure 14. Power Supply Rejection Ration for  $V_{OUT}$  = 2.8 V,  $C_{OUT}$  = 1  $\mu F$ 

Figure 15. Output Voltage Noise Spectral Density for  $V_{OUT}$  = 2.8 V,  $C_{OUT}$  = 1  $\mu F$ 

## **APPLICATIONS INFORMATION**

The NCP164C is the member of new family of high output current and low dropout regulators which delivers low quiescent and ground current consumption, good noise and power supply ripple rejection ratio performance. The NCP164C incorporates EN pin and power good output for simple controlling by MCU or logic. Standard features include current limiting, soft–start feature and thermal protection.

## Input Decoupling (CIN)

It is recommended to connect at least 1  $\mu F$  ceramic X5R or X7R capacitor between IN and GND pin of the device. This capacitor will provide a low impedance path for any unwanted AC signals or noise superimposed onto constant input voltage. The good input capacitor will limit the influence of input trace inductances and source resistance during sudden load current changes. Higher capacitance and lower ESR capacitors will improve the overall line transient response.

## Output Decoupling (COUT)

The NCP164C does not require a minimum Equivalent Series Resistance (ESR) for the output capacitor. The device is designed to be stable with standard ceramics capacitors with values of 1  $\mu$ F or greater. The X5R and X7R types have the lowest capacitance variations over temperature thus they are recommended.

## **Power Good Output Connection**

The NCP164C include Power Good functionality for better interfacing to MCU system. Power Good output is open collector type, capable to sink up to 10 mA. Recommended operating current is between 10  $\mu$ A and

1 mA to obtain low saturation voltage. External pull-up resistor can be connected to any voltage up to 5.0 V (please see Absolute Maximum Ratings table).

## Power Dissipation and Heat Sinking

The maximum power dissipation supported by the device is dependent upon board design and layout. Mounting pad configuration on the PCB, the board material, and the ambient temperature affect the rate of junction temperature rise for the part. For reliable operation junction temperature should be limited to +125°C, however device is capable to work up to junction temperature +150°C. The maximum power dissipation the NCP164C can handle is given by:

$$P_{D(MAX)} = \frac{\left[T_{J(MAX)} - T_{A}\right]}{R_{\theta,JA}}$$
 (eq. 1)

The power dissipated by the NCP164C for given application conditions can be calculated from the following equations:

$$P_D \approx V_{IN}(I_{GND}(I_{OLIT})) + I_{OLIT}(V_{IN} - V_{OLIT})$$
 (eq. 2)

or

$$V_{IN(MAX)} \approx \frac{P_{D(MAX)} + (V_{OUT} \times I_{OUT})}{I_{OUT} + I_{GND}}$$
 (eq. 3)

#### Hints

VIN and GND printed circuit board traces should be as wide as possible. When the impedance of these traces is high, there is a chance to pick up noise or cause the regulator to malfunction. Place external components, especially the output capacitor, as close as possible to the NCP164C, and make traces as short as possible.

#### **Adjustable Version**

Not only adjustable version, but also any fixed version can be used to create adjustable voltage, where original fixed voltage becomes reference voltage for resistor divider and feedback loop. Output voltage can be equal or higher than original fixed option, while possible range is from 1.1 V up to 4.5 V. Figure 16 shows how to add external resistors to increase output voltage above fixed value.

Output voltage is then given by equation

$$V_{OUT} = V_{FIX} \times (1 + R1/R2)$$
 (eq. 4)

where  $V_{FIX}$  is voltage of original fixed version (from 1.2 V up to 4.5 V) or adjustable version (1.1 V). Do not operate the device at output voltage about 4.7 V, as device can be damaged.

In order to avoid influence of current flowing into SNS pin to output voltage accuracy (SNS current varies with voltage option and temperature, typical value is 300 nA) it is recommended to use values of R1 and R2 below 500 k $\Omega$ .

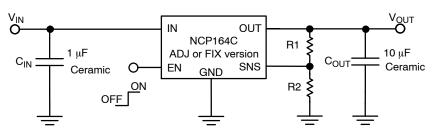

Figure 16. Adjustable Variant Application

Please note that output noise is amplified by  $V_{OUT}/V_{FIX}$  ratio. For example, if original 1.2 V fixed variant is used to create 3.6 V output voltage, output noise is increased 3.6 / 1.2 = 3 times and real value will be  $3 \times 9 \,\mu Vrms = 27 \,\mu Vrms$ . For noise sensitive applications it is recommended to use as

high fixed variant as possible – for example in case above it is better to use 3.3 V fixed variant to create 3.6 V output voltage, as output noise will be amplified only  $3.6 / 3.3 = 1.09 \times (9.8 \,\mu\text{Vrms})$ .
