

THCV226

V-by-One® HS High-speed Video Data Receiver

General Description

THCV226 is designed to support video data transmission between the host and display. This chip can receive 32bit video data and 3bit control data via four differential pairs of V-by-One® HS lanes. This chip in TQFP package supports the video data transmission up to 1080p/10b/120Hz. The maximum serial data rate is 3.4Gbps/lane.

Features

- Normal / High-speed LVDS output selectable
- 1.8V single power supply
- Color depth selectable: 8/10 bits per colors
- Crossing / Distribution mode selectable
- Monitoring signal function
- 1.8V LVC MOS I/O interface
- Package: 128pin 0.4mm-pitch TQFP (16mm x 16mm)
- AC coupling for CML inputs
- CDR requires no external frequency reference
- Supports Spread Spectrum Clocking tolerance with up to 30kHz/±0.5%(center spread)
- V-by-One® HS standard compliant
- PLL requires no external components
- Power down / Output enable mode
- Compliant with RoHS and REACH

Block Diagram

■ Data Transmission Rate of CML Input

Color Depth	Normal Speed LVDS Mode	High-Speed LVDS Mode
8bit	1.2 to 2.7Gbps	1.2 to 2.36Gbps
10bit	1.6 to 3.4Gbps	1.6 to 3.14Gbps

■ Clock Frequency of LVDS Output

Color Depth	Normal Speed LVDS Mode	High-Speed LVDS Mode
8bit	40 to 90MHz	80 to 157MHz
10bit	40 to 85MHz	80 to 157MHz

PIN Configuration

I : LVCMOS Input buffer , O : LVCMOS Output buffer , OD : Open Drain buffer

PWR : 1.8V Power supply , GND : Ground

Functional Description

Functional Overview

With V-by-One® HS's proprietary encoding scheme and CDR (Clock and Data Recovery) architecture, THCV226 enables the transmission of 8 or 10-bit video data, 2-bit synchronizing control data of HSYNC, VSYNC, and Data Enable (DE), by a pair cable with minimal external components.

THCV226 automatically extracts the clock from the incoming data streams and converts the serial data into video data with DE being high or synchronizing control data with DE being low, recognizing which type of serial data is being sent by the transmitter. Also, THCV226 outputs the recovered data in the LVDS data format.

THCV226 can operate for a wide range of a serial bit rate from 1.2Gbps to 3.4Gbps. It is unnecessary to use any external frequency reference, such as a crystal oscillator.

Data Enable Requirement (DE)

There are some requirements for DE signal as described in Figure1 and Figure2.

If DE=Low and MODE0=0, control data of same cycle and particular assigned data bit 'CTL' except the first and last pixel are transmitted. If DE=Low and MODE0=1, control data of same cycle and particular assigned data bit 'CTL' except the first 2cycle and last 2pixel are transmitted. Otherwise video data is transmitted during DE=High. The length of DE being low and high must be at least 8 clock cycles long, as described in Figure15 and Switching Characteristics. DE must be toggled as High -> Low -> High at regular interval. The length of particular DE cycle must be same at all lane.

CTL Bit Transmission

There is particular assigned data bit 'CTL' which can be transmitted at blanking period except the first and the last pixel on DE=Low.

Power Down Mode

Table 3. Power Down Mode

PDN	Operation
1	Normal operation
0	Power down operation

Hot-plug and Lock Detect Function

HTPDN and LOCKN are both open drain outputs from THCV226. Pull-up resistors must be placed at V-by-One® HS transmitter side. See Figure.4 and 5.

If THCV226 is not active (power down mode (PDN=0) or powered off), HTPDN is open. Otherwise, HTPDN is pulled down by THCV226.

HTPDN at V-by-One® HS transmitter side is High when THCV226 is not active or the receiver board is not connected. Then V-by-One® HS transmitter side enters into the power down mode. When HTPDN transits from High to Low, V-by-One® HS transmitter starts up and transmits training pattern for link training.

LOCKN indicates whether THCV226 is in CDR state or not. If THCV226 is in the CDR unlock state, LOCKN is open. Otherwise (in the CDR lock state), it is pulled down by THCV226.

V-by-One® HS transmitter side keeps transmitting training pattern until LOCKN transition to Low. After training is done, THCV226 sinks current, and LOCKN turns to Low. Then V-by-One® HS transmitter side starts transmitting normal video pattern.

Figure 4. HTPDN and LOCKN Scheme

Figure 5. HTPDN and LOCKN Scheme without HTPDN Connection

Multiple-chip Configuration

In order to reduce the number of cables needed for HTPDN and LOCKN in multiple-chip configuration, THCV226 is equipped with the DGLOCK pin. When all the DGLOCK pins are connected as in Figure 6, the connected Rx chips can share the CDR lock status via DGLOCK, making all the Rx chips in the same operation status.

Figure 6. Usage of DGLOCK in Multiple-Rx Configuration

LVDS Reduced Swing Output Function

RS pin controls LVDS output swing level.

Table 4. LVDS Output Level Select

RS	Output Swing Level
0	Reduced Swing Level (200mV typical)
1	Normal Swing Level (350mV typical)

LVDS Output Enable Function

By setting the OE and OPF pins, the following output enable function can be selected.

In output disable condition, all the outputs take low fixed data or High-Z except for HTPDN, LOCKN and DGLOCK.

Table 5. LVDS Output Enable Function

LOCKN	OE	OPF	LVDS Outputs	
			Status	Output Condition
1	1	1	Enable	Low Fixed Data
		0		Hi-Z
	0	1	Disable	Low Fixed Data
		0		Hi-Z
0	1	1	Enable	Normal Data
		0		Normal Data
	0	1	Disable	Low Fixed Data
		0		Hi-Z

LVDS Data Mapping

LVDS data (video data, control data, DE) are mapped as Figure 7. RLC[6] is special bit for DE (data enable). RLC[5:4] are for control data bits, and the other bits are for video data. Also there are special assigned bits, 'CTL' transmitted under DE=0 condition.

The number of LVDS channels depends on color depth mode, COL.

RLD[6] is not available at COL=0, 8-bit color depth mode.

(z=0,1,2,3)

Monitoring Signal Function

The recovered HSYNC, VSYNC, DE or CLK from V-by-One® HS signals can be monitored by “Monitoring Signal Function”. The monitoring lane out of four high-speed data lane is selectable. This function is used for debugging purpose and set by five pins, MON_EN, MON_SEL0/1/2/3.

The monitoring signal is outputted from MONOUT pin as 1.8V LVCMOS signal.

All signals operate as normal mode except these setting pins and monitoring output pin when “Monitoring Signal Function” is enabled. See the table below.

Table 8. Monitoring Signal Function

Pin Option					Monitoring Output	Description

Note

1) LVDS Output Pin Connection

In case that the LVDS Rx of destination device is equipped with pull-up resistors connected to higher than THCV226's VDD voltage, this can cause violation of absolute maximum ratings to THCV226. This phenomenon may be happened at power-on phase and Hi-Z state of the whole system including LVDS Rx device.

One solution for this problem is power-down control for LVDS Rx device during no LVDS input or Hi-Z state period, if its pull-up resistors can be cut off at power-down state. Another solution is to set THCV226's OPF option pin to VDD. This setting provides low fixed data output mode at PDN=1, not Hi-Z state mode.

2) Cable Connection and Disconnection

Do not connect and disconnect the LVDS and CML cables, when the power is supplied to the system.

3) GND Connection

Connect the each GND of the PCB which Transmitter and Receiver. It is better for EMI reduction to place GND cables as close to LVDS and CML cables as possible.

4) Multi-drop Connect

Multi-drop connect is not recommended.

5) Multiple Counterpart Use

Multiple counterpart use such as the following system is not recommended. If it is not avoidable, please check whether tRISK and tRIJT spec of THCV226 can be kept or not. Furthermore, please contact to

6) Multiple Device Connection

HTPDN and LOCKN signals are supposed to be connected properly for their purpose like the following figure. HTPDN should be from just one THCV226 to multiple Tx devices because its purpose is only ignition of all Tx devices. LOCKN should be connected so as to indicate that CDR status of all Rx devices becomes ready to receive normal operation data. LOCKN of Tx side can be simply split to multiple Tx devices. THCV226's DGLOCK is appropriate for multiple Rx use.

Also possible time difference of internal processing time (THCV226 tRDC) on multiple data stream must be accommodated and compensated by the following destination device connected to multiple THCV226s, which may have internal FIFO.

Package

Notices and Requests

1. The product specifications described in this material are subject to change without prior notice.
2. The circuit diagrams described in this material are examples of the application which may not always apply to the customer's design. THine Electronics, Inc. ("THine") is not responsible for possible errors and omissions in this material. Please note even if errors or omissions should be found in this material, THine may not be able to correct them immediately.
3. This material contains THine's copyright, know-how or other intellectual property rights. Copying, reverse-engineer or disclosing to third parties the contents of this material without THine's prior written permission is prohibited.
4. THINE ACCEPTS NO LIABILITY FOR ANY DAMAGE OR LOSS IN CONNECTION WITH ANY DISPUTE RELATING TO INTELLECTUAL PROPERTY RIGHTS BETWEEN THE USER AND ANY THIRD PARTY, ARISING OUT OF THIS PRODUCT, EXCEPT FOR SUCH DAMAGE OR LOSS IN CONNECTION WITH DISPUTES SUCCESSFULLY PROVED BY THE USER THAT SUCH DISPUTES ARE DUE SOLELY TO THINE. NOTE, HOWEVER, EVEN IN THE AFOREMENTIONED CASE, THINE ACCEPTS NO LIABILITY FOR SUCH DAMAGE OR LOSS IF THE DISPUTE IS CAUSED BY THE USER'S INSTRUCTION.
5. This product is not designed for applications that require extremely high-reliability/safety such as aerospace device, nuclear power control device, or medical device related to critical care, excluding when this product is specified for automotive use by THine and used it for that purpose. THine accepts no liability whatsoever for any damages, claims or losses arising out of the uses set forth above.
6. Despite our utmost efforts to improve the quality and reliability of the product, faults will occur with a certain small probability, which is inevitable to a semi-conductor product. Therefore, you are encouraged to have sufficiently fail-safe design principles such as redundant or error preventive design applied to the use of the product so as not to have our product cause any social or public damage.
7. This product may be permanently damaged and suffer from performance degradation or loss of mechanical functionality if subjected to electrostatic charge exceeding capacity of the ESD (Electrostatic Discharge) protection circuitry. Safety earth ground must be provided to anything in contact with the product, including any operator, floor, tester and soldering iron.
8. Please note that this product is not designed to be radiation-proof.
9. Testing and other quality control techniques are used to this product to the extent THine deems necessary to support warranty for performance of this product. Except where mandated by applicable law or deemed necessary by THine based on the user's request, testing of all functions and performance of the product is not necessarily performed.
10. This product must be stored according to storage method which is specified in this specifications. THine accepts no liability whatsoever for any damage or loss caused to the user due to any storage not according to above-mentioned method.
11. Customers are asked, if required, to judge by themselves if this product falls under the category of strategic goods under the Foreign Exchange and Foreign Trade Act in Japan and the Export Administration Regulations in the United States of America on export or transit of this product. This product is prohibited for the purpose of developing military modernization, including the development of weapons of mass destruction (WMD), and the purpose of violating human rights.
12. The product or peripheral parts may be damaged by a surge in voltage over the absolute maximum ratings or malfunction, if pins of the product are shorted by such as foreign substance. The damages may cause a smoking and ignition. Therefore, you are encouraged to implement safety measures by adding protection devices, such as fuses. THine accepts no liability whatsoever for any damage or loss caused to the user due to use under a condition exceeding the limiting values.
13. All patents or pending patent applications, trademarks, copyrights, layout-design exploitation rights or other intellectual property rights concerned with this product belong to THine or licensor(s) of THine. No license or right is granted to the user for any intellectual property right or other proprietary right now or in the future owned by THine or THine's licensor. The user must enter into a license agreement with THine or THine's licensor to be granted of such license or right.
