SGLS346-JUNE 2006

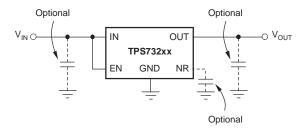

CAP-FREE NMOS 250-mA LOW DROPOUT REGULATOR WITH REVERSE CURRENT PROTECTION

FEATURES

- Controlled Baseline
 - One Assembly/Test Site, One Fabrication Site
- Extended Temperature Performance of -55°C to 125°C
- Enhanced Diminishing Manufacturing Sources (DMS) Support
- Enhanced Product-Change Notification
- Qualification Pedigree (1)
- Stable with No Output Capacitor or Any Value or Type of Capacitor
- Input Voltage Range: 1.7 V to 5.5 V
- Ultralow Dropout Voltage: 40 mV Typ at 250 mA
- Excellent Load Transient Response—with or without Optional Output Capacitor
- New NMOS Topology Provides Low Reverse Leakage Current
- Low Noise: 30 μV_{RMS} Typ (10 kHz to 100 kHz)
- 0.5% Initial Accuracy
- 1% Overall Accuracy (Line, Load, and Temperature)
- Less Than 1 μA Max I_O in Shutdown Mode
- Thermal Shutdown and Specified Min/Max Current Limit Protection
- Available in Multiple Output Voltage Versions
 - Fixed Outputs of 1.2 V to 5 V
 - Adjustable Outputs from 1.2 V to 5.5 V
 - Custom Outputs Available
- (1) Component qualification in accordance with JEDEC and industry standards to ensure reliable operation over an extended temperature range. This includes, but is not limited to, Highly Accelerated Stress Test (HAST) or biased 85/85, temperature cycle, autoclave or unbiased HAST, electromigration, bond intermetallic life, and mold compound life. Such qualification testing should not be viewed as justifying use of this component beyond specified performance and environmental limits.

APPLICATIONS

- Portable/Battery-Powered Equipment
- Post-Regulation for Switching Supplies
- Noise-Sensitive Circuitry such as VCOs
- Point of Load Regulation for DSPs, FPGAs, ASICs, and Microprocessors

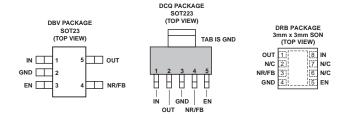

Typical Application Circuit for Fixed-Voltage Versions

DESCRIPTION

The TPS732xx family of low-dropout (LDO) voltage regulators uses a new topology: an NMOS pass element in a voltage-follower configuration. This topology is stable using output capacitors with low ESR and even allows operation without a capacitor. It also provides high reverse blockage (low reverse current) and ground pin current that is nearly constant over all values of output current.

The TPS732xx uses an advanced BiCMOS process to yield high precision while delivering low dropout voltages and low ground pin current. Current consumption, when not enabled, is under 1 μA and ideal for portable applications. The low output noise (30 μV_{RMS} with 0.1 μF $C_{NR})$ is ideal for powering VCOs. These devices are protected by thermal shutdown and foldback current limit.

SGLS346-JUNE 2006

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

ORDERING INFORMATION(1)

PRODUCT	V _{OUT} ⁽²⁾
TPS732xx <i>yyyz</i>	XX is the nominal output voltage (for example, 25 = 2.5 V, 01 = Adjustable ⁽³⁾). YYY is the package designator. Z is the package quantity.

- (1) For the most current specification and package information, see the Package Option Addendum located at the end of this data sheet or see the TI website at www.ti.com.
- (2) Output voltages from 1.2 V to 4.5 V in 50-mV increments are available through the use of innovative factory EEPROM programming; minimum order quantities may apply. Contact factory for details and availability.
- (3) For fixed 1.2 V operation, tie FB to OUT.

ABSOLUTE MAXIMUM RATINGS

over operating junction temperature range unless otherwise noted(1)

V _{IN} range	−0.3 V to 6 V
V _{EN} range	–0.3 V to 6 V
V _{OUT} range	–0.3 V to 5.5 V
Peak output current	Internally limited
Output short-circuit duration	Indefinite
Continuous total power dissipation	See Dissipation Ratings Table
Ambient temperature range, T _A	−55°C to 150°C
Storage temperature range	−65°C to 150°C
ESD rating, HBM	2 kV
ESD rating, CDM	500 V

⁽¹⁾ Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under the Electrical Characteristics is not implied. Exposure to absolute maximum rated conditions for extended periods may affect device reliability.

T _A	Operating ambient	temperature		-55		125	°C	

Minimum V_{IN} = V_{OUT} + V_{DO} or 1.7 V, whichever is greater.
 TPS73201 is tested at V_{OUT} = 2.5 V.
 V_{DO} is not measured for the TPS73214, TPS73215, or TPS73216, since minimum V_{IN} = 1.7 V.
 Fixed-voltage versions only; see the *Applications* section for more information.

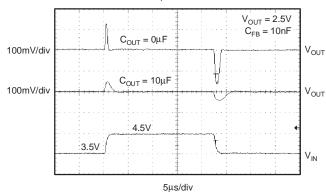

Figure 31.

APPLICATION INFORMATION

The TPS732xx belongs to a family of new generation LDO regulators that use an NMOS pass transistor to achieve ultra-low-dropout performance, reverse current blockage, and freedom from output capacitor constraints. These features, combined with low noise and an enable input, make the TPS732xx ideal for portable applications. This regulator family offers a wide selection of fixed output voltage versions and an adjustable output version. All versions have thermal and over-current protection, including foldback current limit.

Figure 32 shows the basic circuit connections for the fixed voltage models. Figure 33 gives the connections for the adjustable output version (TPS73201).

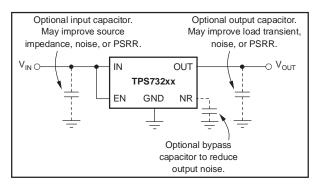

Figure 32. Typical Application Circuit for Fixed-Voltage Versions

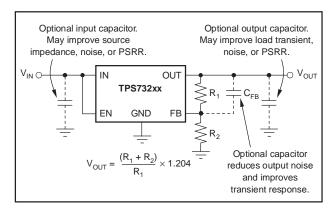

Figure 33. Typical Application Circuit for Adjustable-Voltage Versions

 $R_{\rm 1}$ and $R_{\rm 2}$ can be calculated for any output voltage using the formula shown in Figure 33. Sample resistor values for common output voltages are shown in Figure 3. For the best accuracy, make the parallel combination of $R_{\rm 1}$ and $R_{\rm 2}$ approximately 19 $k\Omega$.

INPUT AND OUTPUT CAPACITOR REQUIREMENTS

Although an input capacitor is not required for stability, it is good analog design practice to connect a 0.1 μ F to 1 μ F low ESR capacitor across the input supply near the regulator. This counteracts reactive input sources and improves transient response, noise rejection, and ripple rejection. A higher-value capacitor may be necessary if large, fast rise-time load transients are anticipated or the device is located several inches from the power source.

The TPS732xx does not require an output capacitor for stability and has maximum phase margin with no capacitor. It is designed to be stable for all available types and values of capacitors. In applications where $V_{\text{IN}}-V_{\text{OUT}}<0.5\ V$ and multiple low ESR capacitors are in parallel, ringing may occur when the product of C_{OUT} and total ESR drops below 50 n ΩF . Total ESR includes all parasitic resistances, including capacitor ESR and board, socket, and solder joint resistance. In most applications, the sum of capacitor ESR and trace resistance will meet this requirement.

OUTPUT NOISE

A precision band-gap reference is used to generate the internal reference voltage, V_{REF} . This reference is the dominant noise source within the TPS732xx and it generates approximately 32 μV_{RMS} (10 Hz to 100 kHz) at the reference output (NR). The regulator control loop gains up the reference noise with the same gain as the reference voltage, so that the noise voltage of the regulator is approximately given by:

$$V_{\text{N}} = 32 \mu V_{\text{RMS}} \times \frac{(R_{1} + R_{2})}{R_{2}} = 32 \mu V_{\text{RMS}} \times \frac{V_{\text{OUT}}}{V_{\text{REF}}} \tag{1}$$

Since the value of V_{REF} is 1.2V, this relationship reduces to:

$$V_N(\mu V_{RMS}) = 27 \left(\frac{\mu V_{RMS}}{V}\right) \times V_{OUT}(V)$$
 (2)

for the case of no C_{NR}.

An internal 27 k Ω resistor in series with the noise reduction pin (NR) forms a low-pass filter for the voltage reference when an external noise reduction capacitor, C_{NR} , is connected from NR to ground. For $C_{NR}=10$ nF, the total noise in the 10 Hz to 100 kHz bandwidth is reduced by a factor of ~3.2, giving the approximate relationship:

$$V_{N}(\mu V_{RMS}) = 8.5 \left(\frac{\mu V_{RMS}}{V}\right) \times V_{OUT}(V)$$
 (3)

for $C_{NR} = 10nF$.

This noise reduction effect is shown as *RMS Noise Voltage vs C_{NR}* in the Typical Characteristics section.

The TPS73201 adjustable version does not have the noise-reduction pin available. However, connecting a feedback capacitor, $C_{\rm FB}$, from the output to the FB pin reduces output noise and improve load transient performance.

The TPS732xx uses an internal charge pump to develop an internal supply voltage sufficient to drive the gate of the NMOS pass element above $V_{\text{OUT}}.$ The charge pump generates ~250 μV of switching noise at ~2 MHz; however, charge-pump noise contribution is negligible at the output of the regulator for most values of I_{OUT} and $C_{\text{OUT}}.$

BOARD LAYOUT RECOMMENDATION TO IMPROVE PSRR AND NOISE PERFORMANCE

To improve ac performance such as PSRR, output noise, and transient response, it is recommended that the PCB be designed with separate ground planes for V_{IN} and V_{OUT} , with each ground plane connected only at the GND pin of the device. In addition, the ground connection for the bypass capacitor should connect directly to the GND pin of the device.

INTERNAL CURRENT LIMIT

The TPS732xx internal current limit helps protect the regulator during fault conditions. Foldback helps to protect the regulator from damage during output short-circuit conditions by reducing current limit when V_{OUT} drops below 0.5 V. See Figure 12 in the Typical Characteristics section for a graph of I_{OUT} vs V_{OUT} .

SHUTDOWN

The Enable pin is active high and is compatible with standard TTL-CMOS levels. V_{EN} below 0.5 V (max) turns the regulator off and drops the ground pin current to approximately 10 nA. When shutdown capability is not required, the Enable pin can be connected to V_{IN} . When a pullup resistor is used, and operation down to 1.8 V is required, use pullup resistor values below 50 k Ω .

DROPOUT VOLTAGE

The TPS732xx uses an NMOS pass transistor to achieve extremely low dropout. When $(V_{\text{IN}} - V_{\text{OUT}})$ is less than the dropout voltage (V_{DO}) , the NMOS pass device is in its linear region of operation and the input-to-output resistance is the $R_{\text{DS-ON}}$ of the NMOS pass element.

For large step changes in load current, the TPS732xx requires a larger voltage drop from $V_{\rm IN}$ to $V_{\rm OUT}$ to avoid degraded transient response. The boundary of this transient dropout region is approximately twice the dc dropout. Values of $V_{\rm IN}$ — $V_{\rm OUT}$ above this line insure normal transient response.

Operating in the transient dropout region can cause an increase in recovery time. The time required to recover from a load transient is a function of the magnitude of the change in load current rate, the rate of change in load current, and the available headroom (V $_{\rm IN}$ to V $_{\rm OUT}$ voltage drop). Under worst-case conditions [full-scale instantaneous load change with (V $_{\rm IN}$ – V $_{\rm OUT}$) close to dc dropout levels], the TPS732xx can take a couple of hundred microseconds to return to the specified regulation accuracy.

TRANSIENT RESPONSE

The low open-loop output impedance provided by the NMOS pass element in a voltage follower configuration allows operation without an output capacitor for many applications. As with any regulator, the addition of a capacitor (nominal value 1 $\mu F)$ from the output pin to ground reduces undershoot magnitude but increase duration. In the adjustable version, the addition of a capacitor, C_{FB} , from the output to the adjust pin also improves the transient response.

The TPS732xx does not have active pulldown when the output is overvoltage. This allows applications that connect higher voltage sources, such as alternate power supplies, to the output. This also results in an output overshoot of several percent if the load current quickly drops to zero when a capacitor is connected to the output. The duration of overshoot can be reduced by adding a load resistor. The overshoot decays at a rate determined by output capacitor C_{OUT} and the internal/external load resistance. The rate of decay is given by:

(Fixed voltage version)

$$dV/dt = \frac{V_{OUT}}{C_{OUT} \times 80k\Omega \parallel R_{LOAD}}$$
(4)

SGLS346-JUNE 2006

(Adjustable voltage version)

$$dV/dt = \frac{V_{OUT}}{C_{OUT} \times 80k\Omega \| (R_1 + R_2) \| R_{LOAD}}$$
 (5)

REVERSE CURRENT

The NMOS pass element of the TPS732xx provides inherent protection against current flow from the output of the regulator to the input when the gate of the pass device is pulled low. To ensure that all charge is removed from the gate of the pass element, the enable pin must be driven low before the input voltage is removed. If this is not done, the pass element may be left on due to stored charge on the gate.

After the enable pin is driven low, no bias voltage is needed on any pin for reverse current blocking. Note that reverse current is specified as the current flowing out of the IN pin due to voltage applied on the OUT pin. There will be additional current flowing into the OUT pin due to the $80\text{-k}\Omega$ internal resistor divider to ground (see Figure 2 and Figure 3).

For the TPS73201, reverse current may flow when V_{FB} is more than 1 V above V_{IN} .

THERMAL PROTECTION

Thermal protection disables the output when the junction temperature rises to approximately 160°C, allowing the device to cool. When the junction temperature cools to approximately 140°C, the output circuitry is again enabled. Depending on power dissipation, thermal resistance, and ambient temperature, the thermal protection circuit may cycle on and off. This limits the dissipation of the regulator, protecting it from damage due to overheating.

Any tendency to activate the thermal protection circuit indicates excessive power dissipation or an inadequate heatsink. For reliable operation, junction temperature should be limited to 125°C maximum. To estimate the margin of safety in a complete design (including heatsink), increase the ambient temperature until the thermal protection is triggered; use worst-case loads and signal conditions. For good reliability, thermal protection should trigger at least

35°C above the maximum expected ambient condition of your application. This produces a worst-case junction temperature of 125°C at the highest expected ambient temperature and worst-case load.

The internal protection circuitry of the TPS732xx has been designed to protect against overload conditions. It was not intended to replace proper heatsinking. Continuously running the TPS732xx into thermal shutdown will degrade device reliability.

POWER DISSIPATION

The ability to remove heat from the die is different for presenting each package type, different considerations in the PCB layout. The PCB area around the device that is free of other components moves the heat from the device to the ambient air. Performance data for JEDEC low-K and high-K boards are shown in the Power Dissipation Ratings table. Using heavier copper increases effectiveness in removing heat from the device. The addition of plated through-holes to heat-dissipating layers also improves the heat-sink effectiveness.

Power dissipation depends on input voltage and load conditions. Power dissipation is equal to the product of the output current times the voltage drop across the output pass element ($V_{\rm IN}$ to $V_{\rm OUT}$):

$$P_{D} = (V_{IN} - V_{OUT}) \times I_{OUT}$$
 (6)

Power dissipation can be minimized by using the lowest possible input voltage necessary to assure the required output voltage.

Package Mounting

Solder pad footprint recommendations for the TPS732xx are presented in Application Bulletin Solder Pad Recommendations for Surface-Mount Devices (AB-132), available from the Texas Instruments web site at www.ti.com.

These items are sold without warranties of any kind.

⁽³⁾ RoHS values: Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

⁽⁴⁾ Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

PACKAGE OPTION ADDENDUM

www.ti.com 4-May-2025

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

TAPE DIMENSIONS KO P1 BO W Cavity A0

	Dimension designed to accommodate the component width
	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

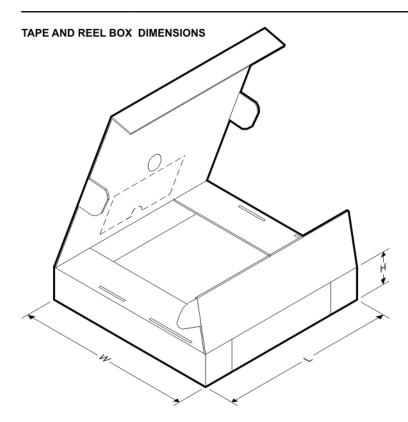

*All dimensions are nominal

SMALL OUTLINE TRANSISTOR

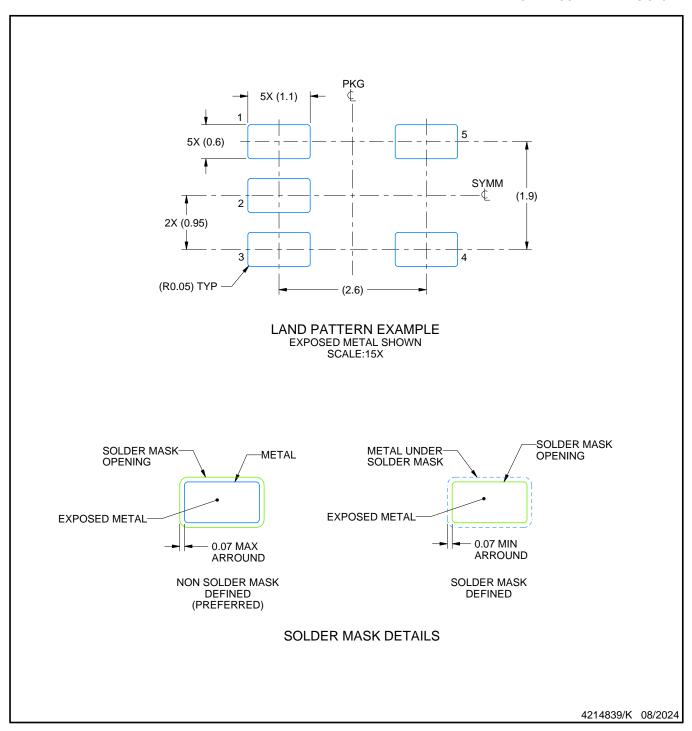

NOTES:

- 1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
 2. This drawing is subject to change without notice.
 3. Reference JEDEC MO-178.

- 4. Body dimensions do not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.25 mm per side.
- 5. Support pin may differ or may not be present.

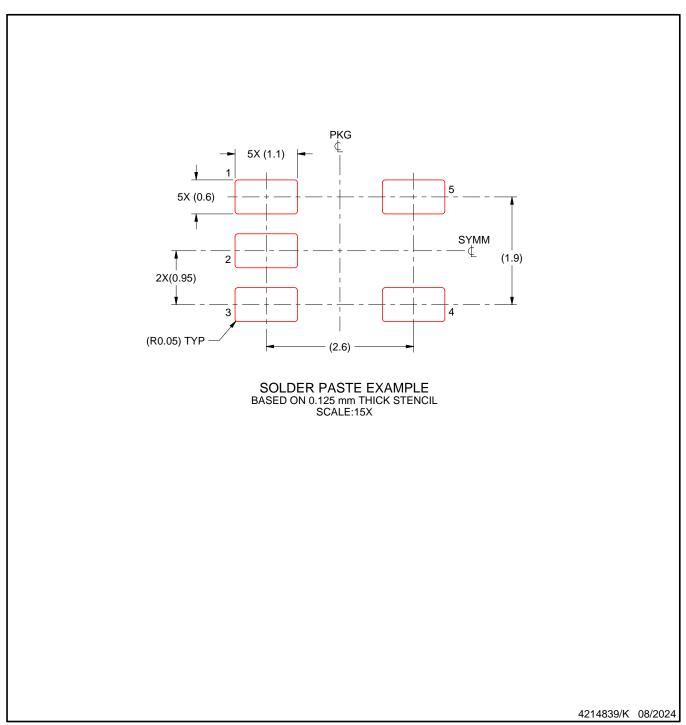

SMALL OUTLINE TRANSISTOR

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

SMALL OUTLINE TRANSISTOR

NOTES: (continued)

- 8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
- 9. Board assembly site may have different recommendations for stencil design.
