Functional Description

CY62158H is a high-performance CMOS low-power (MoBL) SRAM device with embedded ECC.

Device is accessed by asserting both chip enable inputs – $\overline{CE}_1$ as LOW and CE_2 as HIGH.

Write to the device is performed by taking Chip Enable 1 ($\overline{CE}_1$) LOW and Chip Enable 2 (CE_2) HIGH and the Write Enable ($\overline{WE}$) input LOW. Data on the eight I/O pins (I/O_0 through I/O_7) is then written into the location specified on the address pins (A_0 through A_{19}).

Read from the device is performed by taking Chip Enable 1 ($\overline{CE}_1$) and Output Enable ($\overline{OE}$) LOW and Chip Enable 2 (CE_2) HIGH while forcing Write Enable ($\overline{WE}$) HIGH. Under these conditions, the contents of the memory location specified by the address pins will appear on the I/O pins.

The eight input and output pins (I/O_0 through I/O_7) are placed in a high-impedance state when the device is deselected ($\overline{CE}_1$ HIGH or CE_2 LOW), the outputs are disabled ($\overline{OE}$ HIGH), or a write operation is in progress ($\overline{CE}_1$ LOW and CE_2 HIGH and $\overline{WE}$ LOW). See the [Truth Table – CY62158H](#) on page 11 for a complete description of read and write modes.

2. SER FIT Rate <0.1 FIT/Mb. Refer [AN88889](#) for details.

Notes

17. Test conditions assume signal transition time (rise/fall) of 3 ns or less, timing reference levels of 1.5 V (for $V_{CC} \geq 3$ V) and $V_{CC}/2$ (for $V_{CC} < 3$ V), and input pulse levels of 0 to 3 V (for $V_{CC} \geq 3$ V) and 0 to V_{CC} (for $V_{CC} < 3$ V). Test conditions for the read cycle use output loading shown in AC Test Loads and Waveforms section, unless specified otherwise.

18. At any temperature and voltage condition, t_{HZCE} is less than t_{LZCE} , t_{HZOE} is less than t_{LZOE} , and t_{HZWE} is less than t_{LZWE} for any device.

19. Tested initially and after any design or process changes that may affect these parameters.

20. These parameters are guaranteed by design and are not tested.

21. t_{HZOE} , t_{HZCE} , and t_{HZWE} transitions are measured when the outputs enter a high impedance state.

22. The internal write time of the memory is defined by the overlap of $\overline{WE} = V_{IL}$, $\overline{CE}_1 = V_{IL}$, and $CE_2 = V_{IH}$. All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input setup and hold timing must refer to the edge of the signal that terminates the write.

23. The minimum write cycle pulse width for Write cycle No. 2 ($\overline{WE}$ Controlled, $\overline{OE}$ Low) should be equal to the sum of t_{HZWE} and t_{SD} .

Figure 5. Read Cycle No. 2 ($\overline{\text{OE}}$ Controlled)^[25, 26, 27]

Notes

24. The device is continuously selected. $\overline{\text{OE}} = V_{\text{IL}}$, $\overline{\text{CE}} = V_{\text{IL}}$.

25. $\overline{\text{WE}}$ is HIGH for read cycle.

26. For all dual chip enable devices, $\overline{\text{CE}}$ is the logical combination of $\overline{\text{CE}}_1$ and CE_2 . When $\overline{\text{CE}}_1$ is LOW and CE_2 is HIGH, $\overline{\text{CE}}$ is LOW; when $\overline{\text{CE}}_1$ is HIGH or CE_2 is LOW, $\overline{\text{CE}}$ is HIGH.

27. Address valid prior to or coincident with $\overline{\text{CE}}$ LOW transition.

Switching Waveforms (continued)

Figure 6. Write Cycle No. 1 ($\overline{WE}$ Controlled) [28, 29, 30]

Notes

28. For all dual chip enable devices, $\overline{CE}$ is the logical combination of $\overline{CE}_1$ and CE_2 . When $\overline{CE}_1$ is LOW and CE_2 is HIGH, $\overline{CE}$ is LOW; when $\overline{CE}_1$ is HIGH or CE_2 is LOW, $\overline{CE}$ is HIGH.

29. The internal write time of the memory is defined by the overlap of $\overline{WE} = V_{IL}$, $\overline{CE}_1 = V_{IL}$, and $CE_2 = V_{IH}$. All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input setup and hold timing must refer to the edge of the signal that terminates the write.

30. Data I/O is in the high-impedance state if $\overline{CE} = V_{IH}$, or $\overline{OE} = V_{IH}$.

31. During this period, the I/Os are in output state. Do not apply input signals.

Figure 8. Write Cycle No. 3 ($\overline{\text{CE}}$ Controlled)^[32, 33, 34]

Notes

32. For all dual chip enable devices, $\overline{\text{CE}}$ is the logical combination of $\overline{\text{CE}}_1$ and CE_2 . When $\overline{\text{CE}}_1$ is LOW and CE_2 is HIGH, $\overline{\text{CE}}$ is LOW; when $\overline{\text{CE}}_1$ is HIGH or CE_2 is LOW, $\overline{\text{CE}}$ is HIGH.

33. The internal write time of the memory is defined by the overlap of $\overline{\text{WE}} = V_{IL}$, $\overline{\text{CE}}_1 = V_{IL}$, and $\text{CE}_2 = V_{IH}$. All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input setup and hold timing must refer to the edge of the signal that terminates the write.

34. Data I/O is in high impedance state if $\overline{\text{CE}} = V_{IH}$, or $\overline{\text{OE}} = V_{IH}$.

35. The minimum write cycle pulse width should be equal to the sum of the t_{HZWE} and t_{SD} .

36. During this period I/O are in the output state. Do not apply input signals.
