

# THCV241A-P

SerDes transmitter with bi-directional transceiver

## 1 General Description

THCV241A-P is designed to support 4K60fps RAW10 8Mpixel uncompressed video data over long length 100ohm differential STP or single-end 50ohm Coaxial cable with several in-line connectors between camera and processor by V-by-One® HS.

THCV241A-P supports a MIPI CSI-2. Each CSI-2 data lane can transmit up to 1.5Gbps/lane. Virtual channel is supported.

One high-speed V-by-One® HS lane can transmit up to 1080p60fps. The maximum serial data rate is 4Gbps/lane. 2nd output lane supports HDR large amount of data or data copy-and-distribution experience.

THCV241A-P is capable to control and monitor camera module from remote ECU via GPIO, UART or 1Mbps 2-wire serial interface.

Several fault and error detection function including CRC provides hardware functional safety design.

## 2 Features

- MIPI CSI-2 with 1,2 or 4-lane input
- MIPI D-PHY supports 80Mbps~1.5Gbps
- MIPI Virtual channel supported
- Video formats: RAW8/10/12/14/16/20, YUV422/420, RGB888/666/565, JPEG, User-defined generic 8-bit
- V-by-One® HS 400Mbps~4Gbps x2lane
- V-by-One® HS standard version1.5
- Reference clock input CKI range 10~40MHz shareable with video source CMOS sensor
- Wide range IO voltage from 1.7V to 3.6V
- Additional spread spectrum to reduce EMI
- 2-wire serial interface 1Mbps bridge function
- Remote GPIO/UART control and monitoring
- Error detection including CRC and notification
- QFN40 5x5mm 0.4mm pitch Exp-pad package

## 6 Functional Description

### 6.1 Functional Overview

THCV241A-P can receive MIPI CSI-2 video and transmit it to over 15m length. With High Speed CML SerDes, high reliability and robustness encoding scheme and CDR (Clock and Data Recovery) architecture, the THCV241A-P enables to transmit RAW/YUV/RGB/JPEG/Generic8bit data through Main-Link by single 100ohm differential pair or 50ohm Coax cable with minimal external components. Maximum supported resolution is horizontal active 3840 pixels format. In addition, the THCV241A-P has Sub-Link which enables bi-directional transmission of 2-wire serial interface signals, GPIO signals and also HTPDN/LOCKN signals for Main-Link through the other 1-pair of CML-Line. The THCV241A-P system is able to watch peripheral devices and to control them via 2-wire serial interface or GPIOs. They also can report interrupt events caused by change of GPIO inputs and internal statuses such as CRC error.

### 6.2 Reference clock supply

Reference clock supply CKI is required since MIPI CSI-2 clock stream will not always be continuous. CKI frequency examples are 24MHz, 27MHz and 37.125MHz.

To supply the same oscillator clock as CMOS sensor to THCV241A-P is recommended.

See Figure 1.

Physical layout artwork of oscillator clock trace is supposed to be designed to shorten stub branch as possible.

Figure 1. Reference clock supply basic method

Another alternative is to make use of THCV241A-P CKO internal clock buffer function.

CKO clock buffer may strengthen clock drive ability in order to compensate clock signal loss in large structure. On the other hand, additional clock buffer may become another EMI emission source as trade-off.

Figure 2. Reference clock supply clock buffer method (optional)

### 6.3 MIPI input setting

Setting of MIPI input can be configurable by 2-wire access to internal register.

Lane0 of MIPI input must always be used regardless of configuration as an obligation.

Table 1. MIPI input setting

| Addr(h) | Bits  | Register          | width | R/W | Description                                                                                                                                                                      | Default |

## 6.4 HTPDN/LOCKN

### Hot-Plug Function

HTPDN indicates Main-Link connect condition between Transmitter and Receiver. HTPDN of Transmitter side is high when Receiver is not active or not connected. Then Transmitter can enter into power down mode. HTPDN is set to Low by the Receiver when Receiver is active and connects to the Transmitter, and then Transmitter must start up and transmit CDR training pattern for link training. HTPDN is open drain output at the receiver side. Transmitter side needs Pull-up resistor.

There is an application option to omit HTPDN connection between Transmitter and Receiver. In this case, HTPDN at Transmitter side should always be at Low.

### Lock Detect Function

LOCKN indicates whether CDR PLL of Main-Link is in lock status or not. LOCKN at Transmitter input is set to High by pull-up resistor when Receiver is not active or in CDR PLL training. LOCKN is set to Low by Receiver when CDR lock is completed. After that the CDR training mode finishes and then Transmitter shifts to the normal mode. LOCKN of Receiver is open drain. Transmitter side needs pull-up resistor.

When an application omits HTPDN, LOCKN signal should only be considered with HTPDN pulled low by Receiver.

Figure 3. Physical wire connection for wired Hot-plug and Lock detect scheme

It will need same GND potential reference between transmitter and receiver device to connect HTPDN and LOCKN pins directly like above. HTPDN and LOCKN can also be transmitted via Sub-Link without physical wire connection. Assignment can be configurable by 2-wire access to internal register.

Table 2. HTPDN/LOCKN register

| Addr(h) | Bits  | Register     | width | R/W | Description                                                                                                                                                                               | Default |

### 6.5.1 MPRF (Main-Link PRivate Format)

MPRF format encoding preserves original data packet input to THCV241A-P and output the data packet from counterpart V-by-One® HS receiver. The counterpart receiver must have installed MPRF format decoder like THCV242-Q because MPRF is not standard format.

Output V-by-One® HS Byte Mode is 4Byte Mode.

Video formats: RAW8/10/12/14/16/20, YUV422/420, RGB888/666/565, JPEG, and User-defined generic 8-bit are all supported with MPRF.

Figure 4. MPRF (Main-Link PRivate Format)

### 6.5.2 V-by-One® HS standard format

THCV241A-P output format capabilities as transmitter are shown as follows. D[31:0] indicates V-by-One® HS standard version1.5 Packer packet definition. Data can be transmitted normally only when both transmitter and receiver are set to the same available format. Some of the THCV241A-P format may not be supported by particular counterpart receiver because THCV241A-P prepares multiple formats that suit to multiple receiver devices alternatives.

Table 4. V-by-One® HS 1lane output data mapping format 1/3

| R_OUTPUT_FMT                                 | 1                   |                     |                     |              |              |                  |                  |

### 6.5.3 V-by-One® HS output Byte mode

Setting of V-by-One® HS output Byte mode follows format setting or register control.

When V-by-One® HS Self Pattern Generator (BIST) is active, R\_BISTEN=1:Enable, Byte mode is 3Byte fixed.

Table 10. V-by-One® HS output Byte mode setting

| Addr(h) | Bits  | Register       | width | R/W | Description                                                                                                                            | Default |
|---------|-------|----------------|-------|-----|----------------------------------------------------------------------------------------------------------------------------------------|---------|
| 0x1036  | [0]   | R_COL_SEL      | 1     | R/W | V-by-One® HS COL (COLor depth) Byte mode setting method<br>0: AUTO (COL_FMT defined by output format setting)<br>1: Manual (R_COL_MAN) | 1'h0    |
| 0x1037  | [5:4] | R_COL_MAN[1:0] | 2     | R/W | V-by-One® HS Manual Color Depth Select<br>00 : Reserved<br>01 : 8bit (3Byte mode)<br>10 : 10bit (4Byte mode)<br>11 : Reserved          | 2'h2    |

### 6.5.4 V-by-One® HS output Distribution mode

Output of V-by-One® HS lane0 is duplicated and distributed to lane1 output. When Distribution mode is Enabled, R\_HTPDN\_SEL, R\_LOCKN0\_SEL and R\_LOCKN1\_SEL are supposed to be set properly.

Table 11. V-by-One® HS output Distribution mode setting

| Addr(h) | Bits | Register  | width | R/W | Description                                                      | Default |
|---------|------|-----------|-------|-----|------------------------------------------------------------------|---------|
| 0x1053  | [0]  | R_DIST_EN | 1     | R/W | V-by-One® HS Distribution mode Enable<br>0: Disable<br>1: Enable | 1'h0    |

### 6.5.5 V-by-One® HS Low Radiation Emission or High Immunity Resistance mode

V-by-One® HS Low Radiation Emission and High Immunity Resistance mode are available.

Immunity resistance strength is HS (2'b11) > HS (2'b10).

Radiated emission level is HS (2'b11) > HS (2'b10).

Table 12. V-by-One® HS Low Radiation Emission or High Immunity Resistance mode setting

| Addr(h) | Bits  | Register | width | R/W | Description                                                                                                                                                                  | Default |
|---------|-------|----------|-------|-----|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|

### 6.5.6 V-by-One® HS output Odd/Even swap

V-by-One® HS Odd/Even pixel assignment to output lane is adjustable.

Table 13. V-by-One® HS output Odd/Even swap setting

| Addr(h) | Bits | Register     | width | R/W | Description                                                                                              | Default |
|---------|------|--------------|-------|-----|----------------------------------------------------------------------------------------------------------|---------|
| 0x1052  | [0]  | R_ML_OE_SWAP | 1     | R/W | V-by-One® HS 1st Pixel Start Timing Select<br>0:1st pixel assign on lane0<br>1:1st pixel assign on lane1 | 1'h0    |

### 6.5.7 V-by-One® HS output Drivability

V-by-One® HS driver emphasis and strength controls are adjustable.

Table 14. V-by-One® HS output Drivability setting

| Addr(h) | Bits  | Register  | width | R/W | Description                                                                                                                                                                                                             | Default |
|---------|-------|-----------|-------|-----|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|
| 0x1020  | [7:6] | R_ML0_PRE | 2     | R/W | V-by-One® HS lane0 Pre-Emphasis<br>when R_ML0_DRV=00<br>00 : 0% 01 : 50% 10 : 100% 11 : not allowed<br>when R_ML0_DRV=01<br>00 : 0% 01 : 50% 10/11 : not allowed<br>when R_ML0_DRV=10<br>00 : 0% 01/10/11 : not allowed | 2'h0    |

| 0x1020  | [3:2] | R_ML0_DRV | 2     | R/W | V-by-One® HS lane0 Drive Strength Select<br>00: VTOD=200mV<br>01: VTOD=300mV<br>10: VTOD=400mV                                                                                                                          | 2'h2    |
| 0x1020  | [1:0] | R_ML1_DRV | 2     | R/W | V-by-One® HS lane1 Drive Strength Select<br>00: VTOD=200mV<br>01: VTOD=300mV<br>10: VTOD=400mV                                                                                                                          | 2'h2    |

### 6.5.8 V-by-One® HS output Low Frequency mode

V-by-One® HS Low Frequency Mode is available. For usage of Low Frequency mode, counterpart V-by-One® receiver must have installed Low Frequency mode format decoder like THCV236.

Table 15. V-by-One® HS Low Frequency Mode setting

| Addr(h) | Bits | Register | width | R/W | Description                                                         | Default |
|---------|------|----------|-------|-----|---------------------------------------------------------------------|---------|
| 0x101B  | [0]  | R_LFQEN  | 1     | R/W | V-by-One® HS Low FreqModeEnable<br>0:Normal<br>1:Low Frequency Mode | 1'h0    |

### 6.5.9 Target Pixel clock

Target pixel clock for transmission is defined by a formula below.

Relationship between used packet and byte mode packet transfer potential is determined by output format (from Table 4) and whether Auto or Manual Byte-mode setting is used or not in Byte-mode setting (Table 10).

[dmp] = MIPI Data-rate

[nmp] = MIPI lane number

[bmvx1] = V-by-One® HS Byte Mode

[nvx1] = V-by-One® HS lane number

[PCLK.target] = Pixel clock target for V-by-One® HS per lane = [F(target)]

Total pixel data-rate = [dmp] x [nmp]

$$= [\text{PCLK.target}] \times [\text{bmvx1}] \times 8 \times \frac{\text{Used packet in output format}}{\text{Byte mode packet total}} \times [\text{nvx1}]$$

$$[\text{PCLK.target}] = \frac{[\text{dmp}] \times [\text{nmp}]}{[\text{bmvx1}] \times 8 \times \frac{\text{Used packet in output format}}{\text{Byte mode packet total}} \times [\text{nvx1}]} = [\text{F(target)}]$$

### 6.6 Blanking period restriction under low MIPI data-rate environment

First of all, horizontal blanking period must meet minimum required length as MIPI standard defines to change MIPI data lane from Low Power mode to High Speed mode and from High Speed mode to Low Power mode.

In addition for THCV241A-P, when MIPI data-rate per lane is slower than 160Mbps, horizontal blanking period length must meet below rule.

$$\text{Horizontal blanking period (@[dmp]<160Mbps)} > \frac{168}{[\text{dmp}]}$$

Another alternative is simply to use 160Mbps and higher MIPI data-rate because cases to use below 160Mbps must be the cases of [nmp]=4 so that MIPI data-rate can be arranged to be higher by using [nmp]=1 or 2 configuration.

## 6.7 PLL setting

PLL setting is required. For manual setting, R\_PLL\_SET\_MODE is supposed to be set 1 (Manual mode) from default value 0. PLL Manual mode setting set R\_PLL\_SETTING[47:0] is related with CKI frequency.

Figure 5. Reference clock supply basic method

PLL\_SETTING[47:0] must be selected proper to meet below constraints.

Table 16. PLL constraints table

| symbol     | discription                                           | condition                                             | min      | typ | max   | unit |
|------------|-------------------------------------------------------|-------------------------------------------------------|----------|-----|-------|------|
| F(CKI)     | CKI input frequency                                   | -                                                     | 10       | -   | 40    | MHz  |
| FBDiv      | FeedBack Divider value                                | -                                                     | 20       | -   | 130   | -    |
| OutDiv1    | 1st Output Divider value (OutDiv1 must be >= OutDiv2) | -                                                     | 1        | -   | 7     | -    |
| OutDiv2    | 2nd Output Divider value (OutDiv1 must be >= OutDiv2) | -                                                     | 1        | -   | 7     | -    |
| F(VCO)     | VCO frequency                                         | -                                                     | 500      | -   | 1300  | MHz  |
| F(OUT)     | PLL output pixel clock frequency                      | -                                                     | 10       | -   | 133.3 | MHz  |
| $\Delta F$ | Allowed error between F(target) vs F(OUT)             | Hactive<= 1280pixels and [dmp]x[nmp] < 500Mbps        | R_SPREAD | -   | 8     | %    |
|            |                                                       | 1280 <Hactive<= 1920pixels and [dmp]x[nmp] < 800Mbps  |          |     |       |      |
|            |                                                       | 1920 <Hactive<= 3840pixels and [dmp]x[nmp] < 1500Mbps |          |     |       |      |
|            |                                                       | otherwise                                             | 0        | 0   | 8     | %    |

Pixel clock frequency made by PLL is calculated as below.

$$[\text{PCLK.actual}] = \text{Pixel clock actually used for V-by-One® HS per lane} = [\text{F(OUT)}]$$

$$[\text{PCLK.actual}] = [\text{F(OUT)}] = \frac{[\text{F(CKI)}] \times [\text{FBDiv}]}{[\text{OutDiv1}] \times [\text{OutDiv2}]}$$

Actual Pixel clock, F(OUT) frequency must be equal or greater than ideal target Pixel clock, F(target) by 8% accuracy as below formula for most cases.

$$[F(\text{target})] \leq [F(\text{OUT})] \leq [F(\text{target})] \times \frac{108}{100}$$

When transmitted camera image format horizontal active is rather large and total pixel data-rate is rather slow as described in previous table condition, minimum allowed F(OUT) setting is not equal to F(target) if Spread Spectrum function is activated.  $\Delta F$  is supposed to be more than absolute value of applied SSCG modulation rate, |R\_SPREAD|, under the condition specified on PLL constraints table.

$$\Delta F = \frac{[F(\text{OUT})] - [F(\text{target})]}{[F(\text{target})]}$$

Table 17. PLL setting

| Addr(h) | Bits  | Register             | width | R/W | Description                                                              | Default |

## 6.8 PLL Auto setting function

PLL auto setting function is available in case all the following conditions are met.

- ✓ V-by-One® HS output format setting (Address 0x1001) is MPRF.
- ✓ F(CKI) is 37.125MHz or 27MHz or 24MHz.
- ✓ MIPI input data-rate is equal to the integral multiple of F(CKI)

Under PLL auto setting function operation, it is sufficient only to control below resistors. No control on R\_PLL\_SETTING[47:0] is required.

Table 19. PLL Auto setting function control Resistors

| Addr(h) | Bits  | Register         | width | R/W | Description                                                                                                                                                     | Default |

## 6.9 V-by-One® HS output data-rate

V-by-One® HS output data-rate is made of actual Pixel clock frequency.

$$\text{V-by-One® HS physical Data-rate} = [\text{PCLK.actual}] \times [\text{bmvx1}] \times 8 \times \frac{10}{8}$$

At Low Frequency Mode, Data-rate is doubled.

$$\text{V-by-One® HS physical Data-rate on LowFreq.Mode} = [\text{PCLK.actual}] \times [\text{bmvx1}] \times 8 \times \frac{10}{8} \times 2$$

Supported Data-rate is from 400Mbps to 4Gbps.

## 6.10 V-by-One® HS output Spread Spectrum

Spread Spectrum Clock Generation (SSCG) modulation is available to apply on V-by-One® HS output.

$$[\text{PCLK.actual}] \Big|_{\text{no SSCG}} \times \frac{(100 - \|\text{R\_SPREAD}\|)}{100} < [\text{PCLK.actual}] \Big|_{\text{SSCG}} < [\text{PCLK.actual}] \Big|_{\text{no SSCG}} \times \frac{(100 + \|\text{R\_SPREAD}\|)}{100}$$

Table 21. V-by-One® HS output Spread Spectrum settings

| Addr(h) | Bits  | Register       | width | R/W | Description                                                                                                                                                                                                               | Default |

SSCG modulation frequency divider setting values, R\_DIVVAL on Address 0x1010, to meet V-by-One® HS standard 30kHz +/-0.5% are exemplified below.

Table 22. V-by-One® HS output SSCG R\_DIVVAL setting examples

| (MHz)  | (hex.)    | (dec.)   | (kHz) |
|--------|-----------|----------|-------|
| F(CKI) | R_DIVVAL  | R_DIVVAL | fmod  |
| 37.125 | 4'hC(0xC) | 12       | 24.2  |
| 27     | 4'h8(0x8) | 8        | 26.4  |
| 24     | 4'h8(0x8) | 8        | 23.4  |

## 6.11 V-by-One® HS CRC

V-by-One® HS transmission packet payload fault or error can be detected with CRC. THCV241A-P generates and sends check value to receiver. For usage of CRC function, the counterpart V-by-One® receiver must have installed CRC monitor like THCV242A-P.

Table 23. V-by-One® HS CRC setting

| Addr(h) | Bits | Register  | width | R/W | Description                                                                             | Default |
|---------|------|-----------|-------|-----|-----------------------------------------------------------------------------------------|---------|

## 6.12 MIPI Packet Header V-by-One® HS output bridge mode

MIPI PH(Packet Header) can be bridge to V-by-One® HS output following selected schemes.

“R\_PHMODE=2'b01” setting on THCV236 connection is only supported where HFSEL=0 setting is applied on THCV236.

Table 24. V-by-One® HS output MIPI Packet Header bridge setting

| Addr(h) | Bits  | Register | width | R/W | Description                                                                                                                                                                                                          | Default |

Figure 7. MIPI Packet Header V-by-One® HS output bridge bit mapping

### 6.13 MIPI Virtual Channel bridge

When MIPI PH(Packet Header) is bridged to V-by-One® HS output with described schemes above, MIPI Virtual Channel information in PH is bridged to V-by-One® HS at the same time. Virtual Channel is supported.

## 6.14 V-by-One® HS VSYNC generation

Setting of V-by-One® HS VSYNC output is configurable by 2-wire access on internal register.

Internally generated VSYNC (R\_VS\_MODE=1) follows Figure 8.

Table 25. V-by-One® HS output VSYNC setting

Figure 8. Internally generated VSYNC

### 6.15 V-by-One® HS HSYNC generation

Setting of V-by-One® HS HSYNC output is configurable by 2-wire access on internal register.

Internally generated HSYNC in Vertical active period (R\_HS\_MODE=10/11) follows Figure 9.

Internally generated HSYNC in Vertical blanking period (R\_HS\_VB\_EN=10/11) follows Figure 10.

Table 26. V-by-One® HS output HSYNC setting

Figure 9. Internally generated HSYNC in Vertical active period

Figure 10. Internally generated HSYNC in Vertical blanking period

6.16 MIPI Short Packet V-by-One® HS output bridge mode

MIPI SP (Short Packet) can be bridge to V-by-One® HS output with the following schemes.

MIPI Short Packet V-by-One® HS output bridge mode is only supported when “R\_BITMAP\_SEL=2'b00 (MAP1)” or “R\_BITMAP\_SEL=2'b11 (MAP4)”.

“R\_VS\_MODE=1'b0” and “R\_FS\_FE\_SYNCEN=2'b00” setting is required to bridge both MIPI Frame Start and Frame End Short Packet. “R\_VSYNC\_POL=1'b0” setting is required to connect THCV242A-P.

THCV236 connection is only supported where HFSEL=0 setting is applied on THCV236.

## 6.17 2-wire serial interface

### 6.17.1 2-wire serial I/F slave Device ID

To use GPIO (General Purpose Input/Output), fault/error detection, and interrupt function, 2-wire serial I/F enables to access registers. AIN pin determines 2-wire slave Device ID setting.

Table 27. 2-wire serial I/F Device ID select by AIN pin

| Pin Name | Pin # | type* | Description                                                                                              |
|----------|-------|-------|----------------------------------------------------------------------------------------------------------|
| AIN      | 27    | I     | Select Slave Address<br>0 : 2wire serial Address = 7'b000_1011<br>1 : 2wire serial Address = 7'b011_0100 |

As an additional method, 2-wire slave Device ID setting can be changed from default value by register setting.

Table 28. 2-wire serial I/F Device ID select by register setting

| Sub-Link |         | Bits  | Register     | width | R/W | Description                                                                                                                                                                                                                                              | Default | Master or Slave related |

## 6.19 Register Auto Checksum diagnosis

Register values checksum is continuously calculated as R\_CKSUM\_RVAL and checked compared to user-defined target, R\_CKSUM\_VAL. If any change occurs, it can be reported as interrupt.

Table 30. Register Auto Checksum diagnosis control and monitoring

| Sub-Link |         | Bits  | Register         | width | R/W | Description                                                                                                  | Default | Master or Slave related |

## 6.20 Sub-Link setting

Sub-Link Master or Sub-Link Slave operation is selectable by MSSEL pin control.

Sub-Link Master control register address and Sub-Link Slave control register address are different even for the same Sub-Link function register.

Sub-Link Master control register is from 0x0000 to 0x007F.

Sub-Link Slave control register is from 0x0080 to 0x00FF.

As a note, registers other than Sub-Link control register from 0x1000 have only one address for one function, which is independent of Sub-Link operation as Master or Slave.

Sub-Link Master “2-wire Set&Trigger mode1” (R\_SLINK\_MODE setting) is compatible with THCV236.

Sub-Link Polling interval is controllable from 1us to 800us, that may have relationships on fault/error detection, interrupt, or other UART / GPIO transfer time designed on application.

Table 31. Sub-Link Master protocol basic setting

| Sub-Link |         | Bits  | Register           | width | R/W | Description                                                                                                                                                                                                                                                                                                                                             | Default | Master or Slave related |
|----------|---------|-------|--------------------|-------|-----|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------------------|

To use GPIO (General Purpose Input/Output) pin, fault/error detection and interrupt function, “2-wire Set&Trigger mode1” enables remote register access. Sub-Link Master device has 2-wire serial slave block and can connect to HOST MPU, Sub-Link Slave device has 2-wire serial master block and can connect to remote side 2-wire serial slave devices.

HOST MPU can access register of Sub-Link Master device, Sub-Link Slave device and remote side 2-wire serial slave devices.

For “from remote THCV236 Sub-Link Master or from remote THCV242A-P Sub-Link mode1 or remote THCV244A-QP Sub-Link mode1 to THCV241A-P Sub-Link Slave” access, “0x00FE” /”R\_WB\_MSB” and “R\_WA\_MODE” Word Address and Bank setting is required at the beginning before any read access. “0x00FE” Word Address write access from THCV236, THCV242A-P or THCV244A-QP is supposed to be divided into “0x00” and “0xFE” commands by 8bit Sub-Address restriction.

Table 32. Sub-Link Word Address control setting

| Sub-Link       |               | Bits  | Register  | width | R/W | Description                                                                                                                                                                                                                                                                                                                      | Default | Master or Slave related |

Under “1Byte Word Address access” operation (0x00FE bit0=1'b1), 1Byte access to 0xFE has the same meaning as 2Byte access to 0x00FE, being independent of “Word Address Bank MSB setting” (0x00FE bit[6:4]). This procedure enables users to reset Word Address Bank MSB setting on 1Byte Word Address access and Word Address Byte number setting itself.

### 6.20.1 Sub-Link 2-wire Set and Trigger mode (2-wire Normal mode)

Sub-Link Master 2-wire Set&Trigger mode1 (R\_SLINK\_MODE setting) is compatible with THCV236.

HOST MPU can access to Sub-Link Slave's register via THCV241A-P as Sub-Link Master only by THCV241A-P internal local register control and monitoring on 2-wire Set&Trigger mode1.

Figure 16. Host MPU to Sub-Link Slave Register via THCV241A-P access configuration

HOST MPU can access to remote side 2-wire serial slave register via THCV241A-P as Sub-Link Master only by THCV241A-P internal local register control and monitoring on 2-wire Set&Trigger mode1.

Figure 17. Host MPU to 2-wire slave devices connected to Sub-Link Slave via THCV241A-P access configuration

In principle, when Sub-Link bridges 2-wire serial interface communication from Sub-Link Master to Sub-Link Slave or remote side 2-wire serial slave devices, time lag occurs between HOST MPU side 2-wire serial access and Sub-Link Slave internal bus access or remote side 2-wire serial access.

R\_2WIRE\_CLKSEN (Sub-Link Master side register, 0x0042 bit0) selects whether 2-wire serial slave of Sub-Link Master perform clock stretching.

When R\_2WIRE\_CLKSEN = 1, Sub-Link Master device waits HOST MPU until Sub-Link Slave register access or remote side 2-wire serial slave register access complete by clock stretching.

When R\_2WIRE\_CLKSEN = 0, Sub-Link Master device informs HOST MPU that Sub-Link Slave register access or remote side 2-wire serial register access has completed by interruption (detectable on INT pin) without clock stretching.

Figure 18. Sub-Link Master 2-wire slave clock stretching operation

Table 33. 2-wire serial I/F Set&amp; Trigger mode remote access control and monitoring local registers

| Sub-Link |         | Bits  | Register          | width | R/W | Description                                                                                                                                                                                                                                                                                     | Default | Master or Slave related |

## 6.21 Sub-Link Watch Dog Timer

Sub-Link Watch Dog Timer (WDT) is installed to monitor status. When Sub-Link single transaction started but was not normally ended in time, WDT report Interrupt event of “R\_INT\_SLINK\_TMOUT”.

Table 34. Sub-Link WDT setting

| Sub-Link |         | Bits  | Register          | width | R/W | Description                                                                        | Default | Master or Slave related |
|----------|---------|-------|-------------------|-------|-----|------------------------------------------------------------------------------------|---------|-------------------------|

## 6.22 Sub-Link Interrupt detection

For fault/error and significant event detection, Sub-Link prepares mechanism of monitoring for several internal status and interrupt notification. More than one selected factors are logically OR operated for INT pin output. At the same time the OR operated result is informed from Sub-Link Slave to Sub-Link Master.

Detectable interrupts both on Sub-Link Master and Slave are as follows.

- IC Internal event except Sub-Link
- Internal register Checksum error
- 2-wire access time out error
- Sub-Link CRC error
- Sub-Link protocol error
- Sub-Link access time out error

Detectable interrupts as Sub-Link Master are as follows.

- Main-Link LOCKN transition
- Main-Link HTPDN transition
- Sub-Link Slave side factor
- remote 2-wire access on Sub-Link end

Detectable interrupts as Sub-Link Slave are as follows.

- Sub-Link Slave 2-wire master bus clear end
- Sub-Link Slave 2-wire NACK detection

## 6.23 GPIO setting

Setting of GPIO can be configurable by 2-wire access to internal register.

### 6.23.1 Sub-Link Polling GPIO input/output

Local GPIO input is continuously reflected to remote GPIO output via Sub-Link polling. Input pins become target of interrupt monitoring.

Table 35. Sub-Link Polling GPIO setting

| Addr(h) | Bits  | Register       | width | R/W | Description                                                                                                                                                                                                                                                                                                          | Default |

As default setting with THCV236 as Sub-Link Master communication (THCV241A-P as Sub-Link Slave), GPIO1 Sub-Link Polling bridges output from THCV236's GPIO4 Through Mode and GPIO0 Sub-Link Polling bridges output from THCV236's GPIO3 Through Mode respectively.

As default setting with THCV242A-P or THCV244A-QP as Sub-Link Master communication (THCV241A-P as Sub-Link Slave), GPIO1/0 Sub-Link Polling bridges output from THCV242A-P or THCV244A-QP's GPIO Through Mode and GPIO3/2 Sub-Link Polling bridges input to THCV242A-P or THCV244A-QP's GPIO Through Mode respectively.

Polling GPIO Bridging data are sampled every Sub-Link polling, whose basic interval is controlled by register R\_SLINK\_POL\_TIM\_UP/\_DN. Remote 2-wire access may become long transaction and could lengthen Through GPIO polling reflection interval.

Figure 19. Host MPU to Sub-Link Slave Register via THCV241A-P access configuration

Remote UART bridge is supported with Sub-Link Polling GPIO input/output. Remote UART Tx and Rx bridge baud rate is supposed to be designed against Sub-Link Polling interval to accommodate deterministic jitter caused by intermittent Sub-Link communication timing.

### 6.23.2 Register GPIO

GPIO input monitoring and output control are available with register. Input pins become target of interrupt monitoring.

Table 36. Register GPIO setting and status monitoring

| Addr(h) | Bits  | Register           | width | R/W | Description                                                                                                                                                                                                                                                                                                          | Default |

## 6.24 Internal Error / status signal monitoring GPIO output

Internal error or status signal can be monitored as GPIO output by register setting.

Table 37. Internal Error / status signal monitoring GPIO output setting 1/2

| Addr(h) | Bits  | Register    | width | R/W | Description                                                                                                         | Default |

## 6.25 Internal Error / status signal monitoring register

Internal error or status signal can be monitored as register read value.

Error count register can be cleared by particular register write “1” access.

Error status register can be masked to “0” fixed by particular register appropriate write access.

Table 41. Internal Error / status signal monitoring register

| Module    | ERR / ERR_CNT               | CLEAR                  | MASK/EN/OFF      | Description                          |
|-----------|-----------------------------|------------------------|------------------|--------------------------------------|
| Main-Link | R_DHNDL_ERR                 | -                      | R_DHNDL_INT_MSK  | Main-Link Data Handle error          |
| PLL       | PLL_SET_NG                  | -                      | R_PLL_SET_NG_MSK | PLL auto configuration setting error |
| MIPI      | R_RX_CRC_ERR_CNT[15:0]      | R_CRC_ERR_CNT_CLR      | -                | CRC error count by every Line        |
| MIPI      | R_RX_ECC_ERR_CRCT_CNT[15:0] | R_ECC_ERR_CRCT_CNT_CLR | -                | ECC1bit error count by every Line    |
| MIPI      | R_RX_ECC_ERR_DBLE_CNT[15:0] | R_ECC_ERR_DBLE_CNT_CLR | -                | ECC2bit error count by every Line    |
| Sub-Link  | R_SLINK_FBETERR_NUM_*(15:0) | R_SLINK_FBETERR_CLR    | -                | Sub-link Feald BET error count       |

\*H:Enable L:Disable, which is defferent polarity from other mask registers

## 6.26 Interrupt monitoring

Interrupt (INT) detects occurrence of internal error or status signal and then, latch the detected state.

Interrupt factor can be cleared by particular register write “1” access.

Interrupt factor can be masked to “0” fixed by particular register appropriate write access.

Table 42. Interrupt monitoring

| Module    | INT                    | CLEAR                     | MASK/EN/OFF              | Description                                               |
|-----------|------------------------|---------------------------|--------------------------|-----------------------------------------------------------|
| MIPI      | R_ERR_CRC              | R_CRC_ERR_CLR             | R_CRC_CMP_MSK            | MIPI CRC error                                            |
| MIPI      | R_ERR_ECCCOR           | R_ECC_CRCT_ERR_CLR        | R_ECC1_CMP_MSK           | MIPI ECC 1bit error                                       |
| MIPI      | R_ERR_ECCDBL           | R_ECC_DOUBLE_ERR_CLR      | R_ECC2_CMP_MSK           | MIPI ECC 2bit error                                       |

| Sub-Link  | R_INT_EXTI2CS_NACK     | R_INTC_EXTI2CS_NACK       | R_INTM_EXTI2CS_NACK      | Sub-Link Slave 2-wire NACK detection                      |

As a register, interrupt detected state is “1” and cleared state is “0”. When multiple interrupt sources are activated, the OR operated result is indicated as IC external INT pin output, which at the same time can be sent to Sub-Link counterpart device.

As an external INT pin output, open drain output interrupt detected state is “Low” and cleared state is “Hi-Z”, while INT pin CMOS push-pull output interrupt detected state is “High” and cleared state is “Low”.

Table 43. INT pin output control

| Addr(h) | Bits | Register     | width | R/W | Description                                             | Default |
|---------|------|--------------|-------|-----|---------------------------------------------------------|---------|
| 0x1041  | [0]  | R_INT_CMOSEN | 1     | R/W | [IO] INT CMOS/OpenDrain Select<br>0:OpenDrain<br>1:CMOS | 1'h0    |

INT interrupt function is supposed to be cleared before start monitoring any desired status because INT status may have been changed before monitoring activation.

MIPI, Main-Link, GPIO and other modules of THCV241A-P are designed as separated module and not included in Sub-Link Module so that R\_INT\_EXTERNAL factor must be set as “No mask” in order to report those MIPI, Main-Link, GPIO and other Interrupt factor to remote Sub-Link Master.

Figure 20. Interrupt configuration external of Sub-Link module.

## 6.27 Build-In Self-Test pattern generator (BIST)

RGB888 3Byte mode pattern generator is available. Hsync width is 1 pixel fixed. Vsync width is 1 line fixed. Generated pattern is transmitted on Main-Link. As of V-by-One® HS output format, R\_OUTPUT\_FMT register value is ignored and format is fixed to RGB888 when R\_BISTEN = 1, Enabled.

Table 44. V-by-One® HS Build-In Self-Test pattern generator (BIST) setting

| Addr(h) | Bits  | Register          | width | R/W | Description                                                                                                                                                                                                                                                                                                 | Default |

Automatic pattern switching BIST repetition is available.

Gradient setting only effects on particular patterns.

Cursor position can be set by “R\_CURSOR\_H”, “R\_CURSOR\_V” resistor.

## 6.28 Main-Link Field BET

In order to help users to check validity of CML serial line (Main-Link and Sub-Link), THCV241A-P and particular V-by-One® HS receiver have an operation mode in which they act as a bit error tester (BET). In Main-Link Field BET mode, THCV241A-P internally generates test pattern which is then serialized onto the Main-Link CML line. The counterpart particular receiver, that also has BET function mode, receives the data stream and checks bit errors. The generated data pattern is then 8b/10b encoded, scrambled, and serialized onto the CML channel. As for the receiver, the internal test pattern check circuit gets enabled and reports result on a certain pin or register.

Table 46. V-by-One® HS Field BET pattern generator setting

| Addr(h) | Bits | Register   | width | R/W | Description                                                                 | Default |
|---------|------|------------|-------|-----|-----------------------------------------------------------------------------|---------|
| 0x1052  | [1]  | R_ML_BETEN | 1     | R/W | V-by-One® HS Main Filed-BET Enable<br>0 : Normal Mode<br>1 : Filed-BET Mode | 1'h0    |

## 6.29 Sub-Link Field BET operation and output from GPIO

In Sub-Link Field BET mode, Sub-Link Master device internally generates test pattern which is then serialized onto the Sub-Link line. Sub-Link Slave device also has BET function mode. Sub-Link Slave device receives the data stream and checks bit errors. Note that Sub-Link Slave device must be set this mode prior to Sub-Link Master device. Pattern check result is output from BETOUT pin of the Sub-Link Slave device. The BETOUT pin goes LOW whenever bit errors occur, or it stays HIGH when there is no bit error.

LATEN enables latched result of once-error-detected. BETOUT/LATEN output pin is assigned according to priority GPIO0 > GPIO1 > GPIO2 > GPIO3 when the same Sub-Link Field BET MODE Signal overlap several pins as register setting.

Table 47. Sub-Link Field BET result GPIO output setting

| Addr(h) | Bits  | Register     | width | R/W | Description                                                                                                                                                                                                             | Default |

### 6.31 CMOS output drive strength

CMOS output drive strength can be configurable.

Table 49. CMOS output drive strength setting

| Addr(h) | Bits  | Register      | width | R/W | Description                                                                                                                          | Default |
|---------|-------|---------------|-------|-----|--------------------------------------------------------------------------------------------------------------------------------------|---------|
| 0x1040  | [3:0] | R_GPIO_TDRV   | 4     | R/W | GPIO0-3 CMOS IO Drive Strength Select<br>[3]:GPIO3, [2]:GPIO2, [1]:GPIO1, [0]:GPIO0<br>0: Normal Drive<br>1: Strong Drive            | 4'h0    |
| 0x1047  | [6:0] | R_IO_DRV[7:0] | 8     | R/W | CMOS IO Drive Strength Select<br>[6]:INT, [3]:CKO, [1]:SDA, [0]:SCL<br>[5], [4], [2]:ReservedL<br>0: Normal Drive<br>1: Strong Drive | 7'h00   |

6.32 CKO reference clock buffer output

CKO reference clock buffer output can be configurable by 2-wire access to internal register.

Table 50. CKO setting

| Addr(h) | Bits | Register  | width | R/W | Description                                   | Default |
|---------|------|-----------|-------|-----|-----------------------------------------------|---------|
| 0x1076  | [6]  | R_CKOSTOP | 1     | R/W | CKO output source select<br>0:CKI, 1: Low fix | 1'h1    |

### 6.33 Soft Reset

Soft Reset is available by 2-wire access to internal register.

PLL and V-by-One® HS initial statuses are reset state; therefore, Soft Reset is supposed to be released in accordance with appropriate sequence: PLL Soft Reset release => V-by-One® HS TX Soft Reset release.

Table 51. Soft Reset register

| Addr(h) | Bits  | Register    | width | R/W | Description                                                                                                              | Default |
|---------|-------|-------------|-------|-----|--------------------------------------------------------------------------------------------------------------------------|---------|
| 0x1005  | [0]   | R_PLL_SNRST | 1     | R/W | Softw are Reset for PLL<br>0:Softw are Reset Active<br>1:Softw are Reset Release (PLL Normal Operation)                  | 1'h0    |
| 0x1006  | [0]   | R_TX_SNRST  | 1     | R/W | Softw are Reset for V-by-One® HS TX<br>0:Softw are Reset Active<br>1:Softw are Reset Release (Vx1HS TX Normal Operation) | 1'h0    |
| 0x1021  | [0]   | R_C_SNRST   | 1     | R/W | MIPI CSI-2 Soft Reset<br>0:Reset<br>1:Reset Release (MIPI CSI-2 Normal Operation)                                        | 1'h1    |
| 0x1022  | [0]   | R_DCLKSNRST | 1     | R/W | Digital logic Clock Soft Reset<br>0:Reset<br>1:Reset Release (Digital logic Clock Normal Operation)                      | 1'h1    |
| 0x1023  | [0]   | R_MCLKSNRST | 1     | R/W | MIPI Clock Soft Reset<br>0:Reset<br>1:Reset Release (MIPI Clock Normal Operation)                                        | 1'h1    |
| 0x10FF  | [7:0] | R_REGSNRST  | 8     | R/W | Register Soft Reset<br>AA:Reset<br>others:Reserved                                                                       | 8'h00   |

Also, change of PLL and V-by-One® HS parameters automatically cause Soft Reset without any touch on R\_PLL\_SNRST nor R\_TX\_SNRST, whose temporary reset time length can be defined by R\_PLL\_CTERM and R\_TX\_CTERM respectively.

Table 52. Automatic Soft Reset of PLL and V-by-One® HS recovery time control

| Addr(h) | Bits  | Register    | width | R/W | Description                                                                                                                                                                                                                                                                   | Default |
|---------|-------|-------------|-------|-----|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|

| 0x105C  | [7:0] | R_TX_CTERM  | 8     | R/W | V-by-One® HS parameter change<br>automatic reset recovery time length<br>00 Disable(Disable Auto Soft Reset)<br>01 1*256*tOSC (typ.3.2us)<br>02 2*256*tOSC (typ.6.4us)<br>03 3*256*tOSC (typ.9.6us)<br>:<br>:<br>FE 254*256*tOSC (typ.812.8us)<br>FF 255*256*tOSC (typ.816us) | 8'h55   |

The registers that may trigger PLL automatic Soft Reset are as follows.

If R\_PLL\_SET\_MODE=0,

R\_CK1\_FREQ  
R\_MIPI\_MULT  
R\_VX1\_LANE  
R\_OUTPUT\_FMT  
R\_HFSEL  
R\_RX\_LANE\_SEL\_EN

else if R\_PLL\_SET\_MODE=1,

R\_PLL\_SETTING[47:0]  
R\_DIVVAL

on both R\_PLL\_SET\_MODE=0 and R\_PLL\_SET\_MODE=1,

R\_SPREAD  
R\_DISABLE\_SSCG

The registers that may trigger V-by-One® HS automatic Soft Reset are as follows.

R\_NHSEL  
R\_LFQEN  
R\_ML0\_PRE  
R\_ML1\_PRE  
R\_ML0\_DRV  
R\_ML1\_DRV  
R\_COL\_SEL  
R\_COL\_MAN[1:0]  
R\_OUTPUT\_FMT  
R\_HFSEL  
R\_BITMAP\_SEL

### 6.34 Power On Sequence

Power On Sequence must be controlled appropriate.

MIPI, PLL and V-by-One® HS block are reset state at power on default and require Reset Release.

. MIPI Soft Reset / PLL Soft Reset => V-by-One® HS Soft Reset is proper. See below detail.

Figure 21. Power On Sequence procedure

Table 53. Power On Sequence specification

| Symbol | Parameter                                      | Min                   | Typ | Max | Unit |
|--------|------------------------------------------------|-----------------------|-----|-----|------|
| t1     | 3.3V to 1.2V                                   | 0                     | -   | -   | us   |
| t3     | PDN0 Reset Release Time                        | 0                     | -   | -   | us   |
| t5     | Required wait from PDN0=H to Register Access   | 300                   | -   | -   | us   |
| t6     | Required wait from CKI input to PLL Enable     | 200                   | -   | -   | us   |
| tLT    | Required wait from PLL Lock Time to CML output | $\frac{1000}{F(CKI)}$ | -   | -   | us   |
| tPLL0  | V-by-One® HS Reset Release to CML Out Delay    | -                     | -   | 250 | us   |

### 6.35 Lock / Re-Lock Sequence

Lock and re-lock sequence are as follows. V-by-One® HS automatically shifts into lock status from initial status or unlock status caused by external noise under appropriate parameter set condition.

#### THCV241A-P LOCK Sequence

Figure 22. Lock Sequence

#### THCV241A-P Re-LOCK Sequence

Figure 23. Re-Lock Sequence

Table 54. Lock / Re-Lock Sequence specification

| Symbol | Parameter                                | Min | Typ | Max                   | Unit |
|--------|------------------------------------------|-----|-----|-----------------------|------|
| tTNP0  | LOCKN=H to Training pattern output delay | -   | -   | 2                     | us   |
| tTNP1  | LOCKN=L to Data pattern output delay     | -   | -   | $\frac{1200}{F(OUT)}$ | us   |

## 7 Absolute Maximum Ratings

Table 55. Absolute Maximum Ratings\*

| Parameter                                        | Min  | Typ | Max          | Unit   |
|--------------------------------------------------|------|-----|--------------|--------|
| Supply Voltage VDDH (VDDIO, VDDDB)               | -0.3 | -   | 4            | V      |
| Supply Voltage VDD12 (VDDM, VDDOP, VDDL, VDDA)   | -0.3 | -   | 1.6          | V      |
| LVC MOS Input Voltage                            | -0.3 | -   | VDDIO+0.3 *1 | V      |
| MIPI Input Voltage                               | -0.3 | -   | VDDM+0.3 *2  | V      |
| CML Transmitter Output Voltage                   | -0.3 | -   | VDDA+0.3 *2  | V      |
| CML Bi-directional buffer Input / Output Voltage | -0.3 | -   | VDDDB+0.3 *1 | V      |
| Storage Temperature Range                        | -55  | -   | 125          | °C     |
| Junction temperature                             | -    | -   | 125          | °C     |
| Reflow Peak Temperature/Time                     | -    | -   | 260/10       | °C/sec |

\*1 Max. must be below 4V at the same time

\*2 Max. must be below 1.6V at the same time

\* “Absolute Maximum Ratings” are values of safety limit for a device beyond which a device safety cannot be guaranteed.

They do not imply that a device should be operated at these limits. The tables of “Recommended Operating Conditions” specify conditions for device operation.

## 8 Recommended Operating Conditions

Table 56. Recommended Operating Conditions

| Symbol | Parameter                                     | Min | Typ | Max | Unit |
|--------|-----------------------------------------------|-----|-----|-----|------|
| VDDH   | Supply Voltage (VDDIO, VDDDB)                 | 1.7 | -   | 3.6 | V    |
| VDD12  | Supply Voltage 1.2V (VDDM, VDDOP, VDDL, VDDA) | 1.1 | -   | 1.3 | V    |
| Ta     | Operating Ambient Temperature                 | -40 | -   | 105 | °C   |

## 9 Consumption Current

Table 57. Consumption Current 1/2

| Symbol    | Parameter                                             | Condition                                             | Min | Typ   | Max | Unit |

### 13 Notices and Requests

1. The product specifications described in this material are subject to change without prior notice.
2. The circuit diagrams described in this material are examples of the application which may not always apply to the customer's design. THine Electronics, Inc. ("THine") is not responsible for possible errors and omissions in this material. Please note even if errors or omissions should be found in this material, THine may not be able to correct them immediately.
3. This material contains THine's copyright, know-how or other intellectual property rights. Copying, reverse-engineer or disclosing to third parties the contents of this material without THine's prior written permission is prohibited.
4. THINE ACCEPTS NO LIABILITY FOR ANY DAMAGE OR LOSS IN CONNECTION WITH ANY DISPUTE RELATING TO INTELLECTUAL PROPERTY RIGHTS BETWEEN THE USER AND ANY THIRD PARTY, ARISING OUT OF THIS PRODUCT, EXCEPT FOR SUCH DAMAGE OR LOSS IN CONNECTION WITH DISPUTES SUCCESSFULLY PROVED BY THE USER THAT SUCH DISPUTES ARE DUE SOLELY TO THINE. NOTE, HOWEVER, EVEN IN THE AFOREMENTIONED CASE, THINE ACCEPTS NO LIABILITY FOR SUCH DAMAGE OR LOSS IF THE DISPUTE IS CAUSED BY THE USER'S INSTRUCTION.
5. This product is not designed for applications that require extremely high-reliability/safety such as aerospace device, nuclear power control device, or medical device related to critical care, excluding when this product is specified for automotive use by THine and used it for that purpose. THine accepts no liability whatsoever for any damages, claims or losses arising out of the uses set forth above.
6. Despite our utmost efforts to improve the quality and reliability of the product, faults will occur with a certain small probability, which is inevitable to a semi-conductor product. Therefore, you are encouraged to have sufficiently fail-safe design principles such as redundant or error preventive design applied to the use of the product so as not to have our product cause any social or public damage.
7. This product may be permanently damaged and suffer from performance degradation or loss of mechanical functionality if subjected to electrostatic charge exceeding capacity of the ESD (Electrostatic Discharge) protection circuitry. Safety earth ground must be provided to anything in contact with the product, including any operator, floor, tester and soldering iron.
8. Please note that this product is not designed to be radiation-proof.
9. Testing and other quality control techniques are used to this product to the extent THine deems necessary to support warranty for performance of this product. Except where mandated by applicable law or deemed necessary by THine based on the user's request, testing of all functions and performance of the product is not necessarily performed.
10. This product must be stored according to storage method which is specified in this specifications. THine accepts no liability whatsoever for any damage or loss caused to the user due to any storage not according to above-mentioned method.
11. Customers are asked, if required, to judge by themselves if this product falls under the category of strategic goods under the Foreign Exchange and Foreign Trade Act in Japan and the Export Administration Regulations in the United States of America on export or transit of this product. This product is prohibited for the purpose of developing military modernization, including the development of weapons of mass destruction (WMD), and the purpose of violating human rights.
12. The product or peripheral parts may be damaged by a surge in voltage over the absolute maximum ratings or malfunction, if pins of the product are shorted by such as foreign substance. The damages may cause a smoking and ignition. Therefore, you are encouraged to implement safety measures by adding protection devices, such as fuses. THine accepts no liability whatsoever for any damage or loss caused to the user due to use under a condition exceeding the limiting values.
13. All patents or pending patent applications, trademarks, copyrights, layout-design exploitation rights or other intellectual property rights concerned with this product belong to THine or licensor(s) of THine. No license or right is granted to the user for any intellectual property right or other proprietary right now or in the future owned by THine or THine's licensor. The user must enter into a license agreement with THine or THine's licensor to be granted of such license or right.
