ADG3232

#### **FEATURES**

Operates from 1.65 V to 3.6 V Supply Rails **Unidirectional Signal Path, Bidirectional Level Translation Tiny 8-Lead SOT-23 Package Short Circuit Protection** LVTTL/CMOS Compatible Inputs

**APPLICATIONS Level Translation** Low Voltage ASIC Translation **Low Voltage Clock Switching Serial Interface Translation** 

#### FUNCTIONAL BLOCK DIAGRAM

#### **GENERAL DESCRIPTION**

The ADG3232 is a level translator 2-1 mux designed on a submicron process and operates from supplies as low as 1.65 V. The device is guaranteed for operation over the supply range 1.65 V to 3.6 V. It operates from two supply voltages, allowing bidirectional level translation, i.e., it translates low voltages to higher voltages and vice versa. The signal path is unidirectional, meaning data may flow only from A to Y.

This type of device may be used in applications requiring communication between devices operating from different supply levels.

The level translator mux is packaged in one of the smallest footprints available for its pin count. The 8-lead SOT-23 package requires only 8.26 mm × 8.26 mm of board space.

#### PRODUCT HIGHLIGHTS

- 1. Bidirectional level translation matches any voltage level from 1.65 V to 3.6 V.
- 2. The device offers high performance and is fully guaranteed across the supply range.
- 3. Short circuit protection.
- 4. Tiny SOT-23 package.

<sup>\*</sup>Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those listed in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Only one absolute maximum rating may be applied at any one time.

#### PIN CONFIGURATION

#### CAUTION \_

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although the ADG3232 features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

#### **DESCRIPTION**

The ADG3232 is a mux level translating device designed on a submicron process that operates from supplies as low as 1.65 V. The device is guaranteed for operation over the supply range 1.65 V to 3.6 V. It operates from two supply voltages, allowing bidirectional level translation, i.e., it translates lower voltages to higher voltages and vice versa. The signal path is unidirectional, meaning data may only flow from A to Y.

#### A1 and $\overline{EN}$ Input

The A1 and enable  $(\overline{EN})$  inputs have  $V_{II}/V_{IH}$  logic levels so that the part can accept logic levels of  $V_{OI}/V_{OH}$  independent of the value of the supply being used. Both these inputs (A1 and  $\overline{EN}$ ) are capable of accepting inputs outside the  $V_{CC1}$  supply range. There are no internal diodes to the supply rails on these pins, so they can handle inputs above the supply but inside the absolute maximum ratings.

#### Operation

Figure 3 shows the ADG3232 in a typical application; the signal paths are from A1 or A2 to Y. The device will level translate the signal applied to A1/A2 from a  $V_{\rm CC1}$  logic level (this level translation can be either to a higher or a lower supply) and route the signal to the Y output, which will have standard  $V_{\rm OL}/V_{\rm OH}$  levels for  $V_{\rm CC2}$  supplies.

The supplies in Figure 3 may be any combination of supplies, e.g.,  $V_{\rm CC1}$  and  $V_{\rm CC2}$  may be anywhere in the 1.65 V to 3.6 V range.

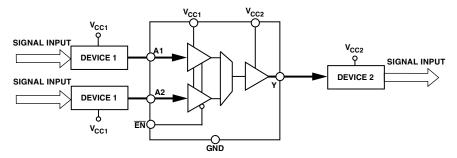

Figure 3. Typical Operation of the ADG3232 Level Translating Switch
