

Tester Click

PID: MIKROE-3083

Tester click is a Click board™ used as a diagnostic tool on the mikroBUS™ socket. It contains an array of 2x6 LEDs, which signalize the presence of the HIGH/LOW logic level on each pin, providing a visual feedback to the developer. Two additional LEDs indicate the presence of +3.3V and +5V on the mikroBUS™ power rails. This simple diagnostic tool can save hours of troubleshooting, saving the application developer from having to connect various complicated measurement instruments, only to test logic states on the specific mikroBUS™ pins.

Each pin of the mikroBUS™ is routed to a red colored LED, which is protected by 1K resistor. This allows voltages up to VCC to be handled with no issues, providing a simple and clean solution for pin state testing. Once placed on the mikroBUS™ socket, no additional settings are required. There are no ICs or other active elements besides the LEDs. Its simplicity makes it very simple to use: as soon as it is connected, red and green power indication LEDs will signalize the presence of +3.3V and +5V on both the mikroBUS™ power rails. The rest of the LED array will be lit according to the state on the respective pin.

How does it work?

Development systems that utilize the mikroBUS™ socket, often require using of wire jumpers and/or connect the measuring equipment, routing the pin to another LED, or using some other workaround, in order to diagnose states on these pins. With the Tester click, this task reduces to placing the Click board™ onto the mikroBUS™ that needs to be tested, and LEDs will indicate if the state on the pin is HIGH or LOW with no additional hardware settings. This simplifies the troubleshooting greatly, potentially saving hours.

Mikroe produces entire development toolchains for all major microcontroller architectures.

Committed to excellency, we are dedicated to helping engineers bring the project development up to speed and achieve outstanding results.

ISO 27001: 2013 certification of informational security management system.
ISO 14001: 2015 certification of environmental management system.
OHSAS 18001: 2008 certification of occupational health and safety management system.

ISO 9001: 2015 certification of quality management system (QMS).

The Click board™ itself consists of an array of 2x6 red colored LEDs, with their anodes connected each to the respective mikroBUS™ pin, via the 1K resistor. This resistor limits the current through the diode, allowing more than 5V to be handled with no problems. Each LED is clearly labeled the same as the pin it is connected to (e.g. PWM pin is routed to the LED labeled as PWM). Besides the 2x6 LED array, there are two additional LEDs, connected to the 3.3V and 5V power rails of the mikroBUS™, indicating presence of the VCC on both power rails. This simple design provides an easy, quick and simple tool to diagnose states of the mikroBUS™ pins.

To fully understand how to use this Click board™, its best to get familiar with the mikroBUS™ concept, first. The mikroBUS™ is a standardized connector, used on most of MikroElektronika development systems. Among other things, it strictly defines the pinout of the connector, offering all the most commonly used interfaces: SPI, I2C, UART, PWM, analog input pin (AN) and few additional GPIO pins (chip select pin - CS, interrupt pin - INT, and reset pin - RST). Also, mikroBUS™ includes two power rails: 3.3V and 5V. This allows development of many different Click boards™ which can be freely exchanged between many different systems and platforms, without any hardware reworks or changes - the appropriate pins will always be at the same place on every system equipped with the mikroBUS™ socket.

Therefore, this Click board™ can be used to verify the signal integrity of the tested mikroBUS™, especially while developing customized systems that include one or more mikroBUS™ sockets, or when developing custom applications. More information about the mikroBUS™ standard and its requirements can be found on the official [mikroBUS™](#) page.

Specifications

Type	Proto
Applications	This Click board™ is an ideal solution for testing and diagnostics of the mikroBUS™ socket pin states.

MikroE produces entire development toolchains for all major microcontroller architectures.

Committed to excellency, we are dedicated to helping engineers bring the project development up to speed and achieve outstanding results.

ISO 27001: 2013 certification of informational security management system.
ISO 14001: 2015 certification of environmental management system.
OHSAS 18001: 2008 certification of occupational health and safety management system.

ISO 9001: 2015 certification of quality management system (QMS).

On-board modules	2x6 red colored LEDs
Key Features	An array of 2x6 red LEDs with the protection resistors, two mode additional LEDs (red and green) for mikroBUS™ power indication, simple to use Click board™ diagnostic tool, no additional settings required
Interface	Analog,GPIO,I2C,PWM,SPI,UART
Feature	No ClickID
Compatibility	mikroBUS™
Click board size	M (42.9 x 25.4 mm)
Input Voltage	3.3V,5V

Pinout diagram

This table shows how the pinout on **TESTER click** corresponds to the pinout on the mikroBUS™ socket (the latter shown in the two middle columns).

Notes	Pin					Pin	Notes
Analog	AN	1	AN	PWM	16	PWM	PWM
Reset	RST	2	RST	INT	15	INT	Interrupt
Chip Select	CS	3	CS	RX	14	TX	UART Transmit
SPI Clock	SCK	4	SCK	TX	13	RX	UART Receive
SPI Data Out	SDO	5	MISO	SCL	12	SCL	I2C Clock
SPI Data In	SDI	6	MOSI	SDA	11	SDA	I2C Data
Power supply	3.3V	7	3.3V	5V	10	5V	Power supply
Ground	GND	8	GND	GND	9	GND	Ground
